- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0AF7

14V Power Module High Temperature

Circuit/System Description

The 14 V power module, also called the accessory DC power control module. The 14 V power module is an electronic device that takes the place of the generator on a traditional vehicle. On a hybrid or electric vehicle the 14 V power module converts high voltage (300 V) direct current (DC) to low voltage (12 V) DC for accessory electrical operation and to charge the 12 V battery. Normally, the 14 V power module only supplies 12 V DC when the vehicle is under a normal drive cycle. There are certain instances when the vehicle is being charged through a standard wall socket where the 14 V power module operation is required to sustain the 12 V battery. The 14 V power module is capable of supplying up to 130 Amps of 12 V DC.

Conditions for Running the DTC

- The ignition is ON.
- The run/crank voltage is 9 V or greater.

Conditions for Setting the DTC

The 14V Power Module Status is Voltage Conversion Disabled or Limited - Due to High Operating Temperature.

Actions Taken When the DTC Sets

- The charging system light will illuminate, and Service Battery Charging System will display on the Driver Information Center.
- DTC P0AF7 is a Type C DTC.

Conditions for Clearing the DTC

DTC P0AF7 is a Type C DTC.

Diagnostic Aids

This DTC may set due to inadequate cooling of the 14V power module. A faulty hybrid/EV electronics coolant pump, hybrid/EV electronics coolant fan, or restricted coolant lines could cause high 14V power module operating temperatures.

Reference Information

Schematic Reference

- **Hybrid/EV Controls Schematics**

Description and Operation

- **Hybrid Modes of Operation Description**
- **Hybrid/EV Cooling System Description and Operation**

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Inspect for proper coolant level in the radiator surge tank.
    - **If coolant level is low**

      Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling** . Repair the cause of low coolant level.

    - **If coolant level is OK**
2. Inspect the hybrid/EV cooling system for leaks.
    - **If a leak is found**

      Repair or replace the leaking component. Refer to the appropriate repair.

    - **If a leak is not found**
3. Inspect the hybrid/EV cooling hoses for pinches or obstructions.
    - **If a concern is found**

      Repair or replace hoses as necessary.

    - **If a concern is not found**
4. Inspect the hybrid/EV electronics cooling system radiator for debris or obstruction.
    - **If a concern is found**

      Repair or replace the restricted or damaged components as necessary.

    - **If a concern is not found**
5. Inspect for proper operation of the hybrid/EV system coolant pump.
    - **If a concern is found**

      Repair or replace the coolant pump as necessary.

    - **If a concern is not found**
6. If the DTC sets: Replace - 14V Power Module

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair:**Diagnostic Repair Verification**

For replacement of 14V Power Module - **Accessory DC Power Control Module Replacement**

DTC U3001, U3003, U3006-U3009, U3013, U3014, U3018, U3019, OR U3500-U350B: CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC U350B

Control Module Input Power "C" Circuit Intermittent/Erratic

Circuit/System Description

The vehicle control modules or sensors monitor the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 9 V for approximately 5 s.

Action Taken When the DTC Sets

- A driver information center message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the charging system.
- A possible cause of this DTC could be overcharging with a battery charger or jump starting.

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition OFF, measure and record the battery voltage at the battery terminals.
2. Verify the battery voltage stabilizes between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.
   - **If battery voltage is less than 12.4 V or more than 12.8 V**

     Refer to **Battery Inspection/Test**.

   - **If battery voltage is between 12.4 and 12.8 V**
3. Engine running, headlights ON, measure and record the battery voltage at the battery terminals.
4. Verify the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.
   - **If the voltage is not at least 1 V greater than the voltage measured in step 1 or is greater than 15 V.**

     Refer to **Charging System Test**.

   - **If the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.**
5. Verify the appropriate control module battery voltage and ignition voltage parameters are available in the scan tool.
   - **If parameters are not available in the scan tool**

     Refer to Circuit/System Testing

   - **If parameters are available in the scan tool**
6. Verify the appropriate control module scan tool battery voltage and ignition voltage parameters are within 1 V of the battery voltage.
   - **If not within 1 V of the battery voltage**

     Refer to Circuit/System Testing

   - **If within 1 V of the battery voltage**
7. All OK.

Circuit/System Testing

NOTE: **Use the schematic to identify the following:**

- **Control modules the vehicle is equipped with**
- **The control module's ground, B+, and Ignition circuit terminal IDs and connectors**

NOTE: **Some control module ground circuits may require up to 20 min after the ignition is turned off before achieving a resistance reading of less than 5 Ω. In most cases the readings will drop below 20 Ω within 1 min indicating the control module is going to sleep.**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate control module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the appropriate control module.
    - **If the test lamp illuminates**
4. Ignition ON.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Power Mode Mismatch** .
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the appropriate control module.
    - **If the test lamp illuminates**
6. Replace the control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup.

SYMPTOMS - ENGINE ELECTRICAL

The following steps must be completed before using the symptom tables.

- Perform **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
    - The power modes are correct.
    - The control modules can communicate via the serial data link.
    - There are no DTCs set.
- Review the system descriptions and operations in order to familiarize yourself with the system functions. Refer to one of the following system operations:
    - **Battery Description and Operation**
    - **Charging System Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the 12 V charging system. Refer to **Checking Aftermarket Accessories** .

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Battery Inspection/Test**
- **Battery Charging**
- **Battery Electrical Drain/Parasitic Load Test**
- **Charging System Test**

BATTERY INSPECTION/TEST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

NOTE: **For Warranty repairs -**

You must use regionally required battery test equipment for warranty repairs.

For accurate test results the battery must be disconnected from the vehicle and the equipment connected directly to the battery posts. When setting up the equipment, select "Out of Vehicle" and then the correct battery type (Flooded, AGM, or Stop/Start AGM) and rated CCA (both from the battery label) must be entered.

- **Failure to obtain the correct connections during the test may result in a failed test on a good battery.**
- **Use the Out of Vehicle test (battery disconnected with test equipment connected directly to the posts) for each battery when testing a vehicle with dual batteries.**

Special Tools

EL 50313 Battery Tester

Circuit/System Testing

WARNING: **Unless directed otherwise, the ignition must be OFF with the key removed, and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.**

For Vehicles equipped with OnStarÃ‚Â® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStarÃ‚Â® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStarÃ‚Â®module). Do not disconnect the main vehicle battery or remove the OnStarÃ‚Â® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStarÃ‚Â® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStarÃ‚Â® Back-Up Battery system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

1. Verify the C1 Battery case is not cracked, broken, or damaged, which may be indicated by battery acid leakage.
    - **If there is any apparent damage**

      Replace the C1 Battery.

    - **If there is no damage**
2. Verify that the battery cables are clean and tight. The battery terminal bolts should be torqued as specified in **Fastener Specifications**.
    - **If the battery cables need to be cleaned or tightened**

      Clean as required and tighten as specified.

    - **If the battery cables are clean and tight**
3. Disconnect battery from the vehicle. There is no need to remove the battery from the vehicle.
4. Connect the EL-50313 directly to the battery terminal posts.
5. Select "Charging," "Diagnostic" and "Out of Vehicle" when setting up the test.
6. Select the proper battery type, Flooded, AGM or Stop/Start AGM.
7. Enter the CCA as shown on the battery label.
8. Verify the test result is not REPLACE BATTERY or BAD CELL-REPLACE

    NOTE: **Always write the test code displayed by the tester on the repair order for any warranty purposes. The number is a unique code that describes the test data for a particular battery at a particular time. The test code may occasionally repeat when you retest the same battery. More often, each test will result in a different code. Use the test code from the Out of Vehicle test.**

    - **If the test result is REPLACE BATTERY or BAD CELL-REPLACE**

      Replace the C1 Battery.

        - **If the test result is not REPLACE BATTERY or BAD CELL-REPLACE**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Battery Replacement

BATTERY CHARGING

12 V Battery

The following procedure is for the 12 V battery only.

Special Tools

EL 50313 Midtronics GR8 Battery Tester Charger

For equivalent regional tools, refer to **Special Tools**.

Diagnostic Aids

NOTE: **This vehicle is equipped with an Absorbent Glass Matt Battery. This type of battery requires different charging and testing parameters than the more common regular flooded lead acid type battery. ANY time you perform charging and or testing you MUST set up the charging/testing equipment or permanent damage to the battery may result.**

- The charging area should be well ventilated.
- Do not charge a battery that appears to be frozen. Allow the battery to warm to room temperature and test it using the EL 50313 before charging.
- An AGM battery may be damaged if charged to more than 14.5 V.
- A Flooded Cell battery may be damaged if charged to more than 16.5 V.
- Vehicles with dual batteries must be charged individually which will result in two printouts.

Battery State of Charge

NOTE: **Using voltage to determine the battery's state of charge is only accurate after the battery has been at rest for 24 hours. This is enough time for the acid in each cell to equalize. If the battery has been charged or discharged in the past 24 hours, the battery state of charge will only be an estimate.**

The maintenance-free batteries state of charge is estimated by reading the voltage of the battery across the battery terminals. Because the voltage is affected by current flow into or out of the battery, the engine must be stopped and all electrical loads turned OFF, including parasitic loads, when checking the voltage. The voltage can also be affected if the battery has just been charged or discharged, so it is important to consider what has happened to the battery in the time just before testing. Use the following procedure to determine the battery's state of charge:

1. Be sure all electrical loads are turned OFF.
2. Determine whether the battery has been used in a vehicle or charged within the past 12 hours.
    - If the answer is no, the terminal voltage will be stabilized and no action is necessary before reading the voltage. Skip to step 3.
    - If the answer is yes, terminal voltage will not be stabilized and you should wait 12 hours since the last time the battery was used.
3. Estimate the battery temperature by determining the average temperature to which the battery has been exposed for the past 12 hours.

    NOTE: **The table is accurate to 10 percent only after the battery has been at rest for 12 hours.**

4. Measure the battery voltage at the battery terminals. Refer to the following table to determine the state of charge according to the estimated battery temperature:

Battery Voltage	% Charge at 0Ã‚Â°C (32Ã‚Â°F)	% Charge at 25Ã‚Â°C (75Ã‚Â°F)
12.75 V	100%	100%
12.7 V	100%	90%
12.6 V	90%	75%
12.45 V	75%	65%
12.2 V	65%	45%
12.0 V	40%	20%

Use the state of charge information as follows:

- A battery with a state of charge that is below 65 percent must always be recharged before returning it to service or continuing storage.
- A battery with a state of charge that is 65 percent or greater is generally considered to be charged enough in order to be returned to normal service or in order to continue storage. However, if the battery is being used in slow traffic or with short drive times, or if the temperature is very hot or very cold, the battery should be fully charged, to at least 90 percent, before returning it to service or continuing storage.

Charging Time Required

The time required to charge a battery will vary depending upon the following factors:

- The battery charger capacity - The higher the charger amperage, the less time it will take to charge the battery.
- The state of charge of the battery - A completely discharged battery requires more than twice as much charging time as a half charged battery. In a discharged battery with a voltage below 11 V, the battery has a very high internal resistance and may only accept a very low current at first. Later, as the charging current causes the acid content to increase in the electrolyte, the charging current will increase. Extremely discharged batteries may not activate the reversed voltage protection in some chargers. Refer to the manufacturer's instructions for operating this circuitry.
- The temperature of the battery - The colder the battery is, the more time it takes to recharge the battery. The charging current accepted by a cold battery is very low at first. As the battery warms, the charging current will increase.

Charging Procedure

CAUTION: **Turn OFF the ignition when connecting or disconnecting the battery cables, the battery charger or the jumper cables. Failure to do so may damage the ECM/PCM or other electronic components.**

CAUTION: **Refer to Fastener Caution .**

When charging side-terminal batteries with the battery cables connected, connect the charger to the positive cable bolt and to a ground located away from the battery. When charging side-terminal batteries with the battery cables disconnected, install the battery side terminal adapters and connect the charger to the adapters.

Use the following procedure to charge the battery:

1. Ensure that all of the battery terminal connections are clean and tight.
2. Connect the charger positive lead to the battery positive terminal on the battery or the remote jumper stud underhood.

   CAUTION: **Do not connect the negative charger lead to the housings of other vehicle electrical accessories or equipment. The action of the battery charger may damage such equipment.**

3. Connect the negative charger lead to a solid engine ground or to a ground stud in the engine compartment that is connected directly to the battery negative terminal, but away from the battery. If the negative battery cable is disconnected and a terminal adapter is being used, connect directly to the adapter.
4. Select "Charging," "PDI" and "In Vehicle" when setting up the charger.

5. Select the proper battery type, Flooded, AGM, Spiral AGM or Stop/Start AGM.
6. Enter the CCA as shown on the battery label.

BATTERY ELECTRICAL DRAIN/PARASITIC LOAD TEST

12 V Battery

The following procedure is for the 12 V battery only.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

Components most likely to cause a parasitic draw on the vehicle's battery are switches, relays, and control modules. After the vehicle is turned OFF the control modules will begin to go to sleep (shut OFF). All control modules do not go to sleep at the same time, some may take up to 30 minutes or longer after turning the Vehicle OFF before going to sleep, like the HVAC and body control modules. Others such as the telematics communication interface control module and remote control door lock receiver may periodically wake up then go back to sleep. These are all normal conditions.

Diagnostic Aids

- Rule out any possible aftermarket equipment causing an unacceptable parasitic current drain. Aftermarket accessories installed into the courtesy lamp circuit can cause the inadvertent power timer in the body control module (BCM) to keep resetting. This would cause the BCM to remain awake and cause a current drain on the battery.
- Rule out customer driving habits such as regular short trips that do not allow enough time to properly charge the battery. Refer to **Battery Description and Operation**.
- Verify that the battery and charging system are in proper working order. Refer to **Battery Charging**, and **Charging System Test**.
- A battery discharging for no apparent reason while the vehicle is parked can be caused by an intermittent draw, such as a module waking up, or a continuous draw, such as a dome light or stuck relay.
- Some systems and modules such as OnStarÃ‚Â®, and regulated voltage control, if equipped, are designed to wake-up, perform a task, and go back asleep at regular intervals. Refer to **Body Control System Description and Operation** for the system or modules description and operation.
- An engine off natural vacuum evaporative test can occur if the engine control module (ECM) determines the drive cycle has met the appropriate criteria immediately after key off. The ECM will stay awake and the vent solenoid will stay energized for as long as 45 minutes. The typical current draw for this is about 1 A.
- The telematics communication interface control module current draw is very low, less than 40 mA, so the OnStar system is left in that "awake" state for up to the first 48 hours. Parasitic draw of up to 40 mA with an occasional spike as high as 80 mA through the telematics communication interface control module for the first 48 hours is normal.
- Some automatic climate control systems can remain in a semi-awake state for up to three hours, actual draw amounts vary by vehicle platform but are typically not greater than 50 mA.
- An extremely low mA current level is consumed by the RKE receiver for monitoring purposes, actual system wake up only occurs when the fobs for the vehicle are used. When other devices on the same RKE operating frequency are activated, such as the 4 tire pressure monitoring sensors and other vehicle transmitters in the vicinity, the RKE receiver will have a 100 mA spike. These spikes are normal and occur too briefly to have a significant effect on battery drain. Competing signals may cause RKE performance issues such as jamming but should not cause excessive battery draw.
- If an excessive current draw is not present during initial testing, continue periodic testing over a 1-2 hour period to see if the current draw increases and stays above an unacceptable level.

NOTE: **The battery specification listed below is a generic specification. Refer to the battery specification label on the original battery when testing the battery.**

- The battery run down time will vary depending on the batteries reserve capacity. If the reserve capacity is higher, then the battery run down time would be longer. If the reserve capacity is lower, then the battery run down time would be shorter. The graph below indicates roughly how many days a 690 cold cranking amp battery with a 110 minute reserve capacity starting at 80 percent state of charge will last with a constant current draw until it reaches 50 percent state of charge. Differences in battery reserve capacity and temperature will affect the results.

Current Drain	Days
25 mA	33
50 mA	16.5
75 mA	11
100 mA	8.25
250 mA	3.3
500 mA	1.65
750 mA	1
1 A	0.8
2 A	0.4

Scan Tool Reference

Control Module References for scan tool information

Special Tools

EL 38758 Parasitic Draw Test Switch

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

NOTE:

- **Most vehicle systems will go to sleep within 30 min but it can take up to 2 hours before all systems power down allowing the parasitic draw test to pass. An occasional increase in the parasitic draw is normal as long as it returns within 1 s.**
- **Closing the door latches/ajar switch while leaving the doors open is recommended, this allows the vehicle systems to perform in a "doors closed" mode while allowing vehicle interior access that may be needed to complete the diagnostic steps.**
- **Locking doors will arm the vehicle content theft deterrent system if equipped. Failure to arm the system may cause a theft system fault to not be present during testing.**
- **There are many things that can prevent the vehicle from completely going to sleep and passing the parasitic draw test. Make sure all the conditions listed below are met before performing the parasitic current draw test.**

- **Vehicle OFF**
- **Retained Accessory Power RAP OFF - open and close the driver door after Vehicle OFF**
- **Scan tool not communicating with a vehicle control module - in some cases it may need to be disconnected from the data link connector.**
- **All access doors closed**
- **Headlamps OFF - auto headlamps disabled**
- **Any delay lighting OFF**
- **If equipped with an under hood lamp disable it**
- **HVAC after blow OFF**
- **Any accessory that can work with Vehicle OFF inactive or OFF**
- **Wait up to 2 min or longer, after all other listed conditions are met**

Using an Inductive Pickup Probe

1. Connect an inductive pickup probe to the negative battery cable that can read down to 1 mA.
2. Vehicle OFF, as the vehicle systems shut down test for less than 30 mA of parasitic current drain.
   - If greater than the specified range, refer to Circuit/System Testing.

Using the EL 38758 Parasitic Draw Test Switch

WARNING: **Refer to Battery Disconnect Warning .**

CAUTION: **When a fused jumper wire or digital multimeter is connected to the test switch terminals, always turn the test switch ON before opening any access door, turning the ignition on, or turning any accessory on. This is to prevent damaging the jumper wire or digital multimeter fuse.**

NOTE: **The switch knob on the EL 38758 switch is marked ON and OFF. When the switch knob is in the ON position, the circuit is closed and electrical current will pass through the switch. When the switch knob is in the OFF position, the circuit is open and electrical current will not pass through the switch.**

1. Vehicle OFF, disconnect the battery negative cable from the battery. Refer to **Battery Negative Cable Disconnection and Connection**.
2. Turn the **EL 38758** switch knob to the OFF position.
3. Install the male end of the **EL 38758** switch to the battery ground terminal.
4. Install the battery negative cable to the female end of the **EL 38758** switch.
5. Turn the **EL 38758** switch knob to the ON position.
6. Road test the vehicle and activate all of the accessories such as the radio and air conditioning.
7. Vehicle OFF, connect a 10 A fused jumper wire to the test switch tool terminals.
8. Turn the **EL 38758** switch knob to the OFF position. The current now flows through the jumper wire.
9. Check the fuse in the jumper wire. The fuse should be OK.
   - Failed: If the jumper wire fuse is blown, refer to Circuit/System Testing.
   - Passed
10. Turn the **EL 38758** switch knob to the ON position. Remove the fused jumper wire.
11. Connect a digital multimeter set to the 10 A DC scale between the test switch tool terminals.
12. Turn the **EL 38758** switch knob to the OFF position. The current now flows through the DMM.
13. As the vehicle systems shut down test for less than 30 mA of parasitic current drain.
    - If greater than the specified range, refer to Circuit/System Testing.

Circuit/System Testing

NOTE:

- **Removing or installing a fuse, relay, or connector, to determine the area**

causing high parasitic draw may wake up control modules. You must wait for the control modules to go back to sleep before retesting. It is best to install any removed or disconnected components after the diagnosis is completed.

- **Fuses for power mode master components such as the BCM should be removed last to avoid misdiagnosis.**
- **If a scan tool is connected to the DLC, either disconnect it or subtract the scan tool current draw from the DMM reading to get the actual vehicle parasitic current draw.**

If the vehicle has an unacceptable amount of parasitic current draw, remove each fuse one at a time until the current draw falls to an acceptable level. A drop of more than 10-20 mA, when disabling a single system or circuit, is an indication of an overly high current draw that could be causing the battery drain. Refer to **Power Distribution Schematics** to diagnose exactly which circuit of the suspect system is causing the high parasitic drain. The follow is a list of common components that could cause a high current draw:

- Stuck switch
- Stuck relay
- Control module

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for control module replacement, programming and setup

CHARGING SYSTEM TEST

The accessory power module (APM) supplies the energy that flows between the high voltage (300 volt) direct current (DC) and low voltage (14 volt) DC to charge the 12 volt battery and power accessories. To test the charging system, refer to **DC Power Conversion Test** .

REPAIR INSTRUCTIONS

BATTERY NEGATIVE CABLE DISCONNECTION AND CONNECTION

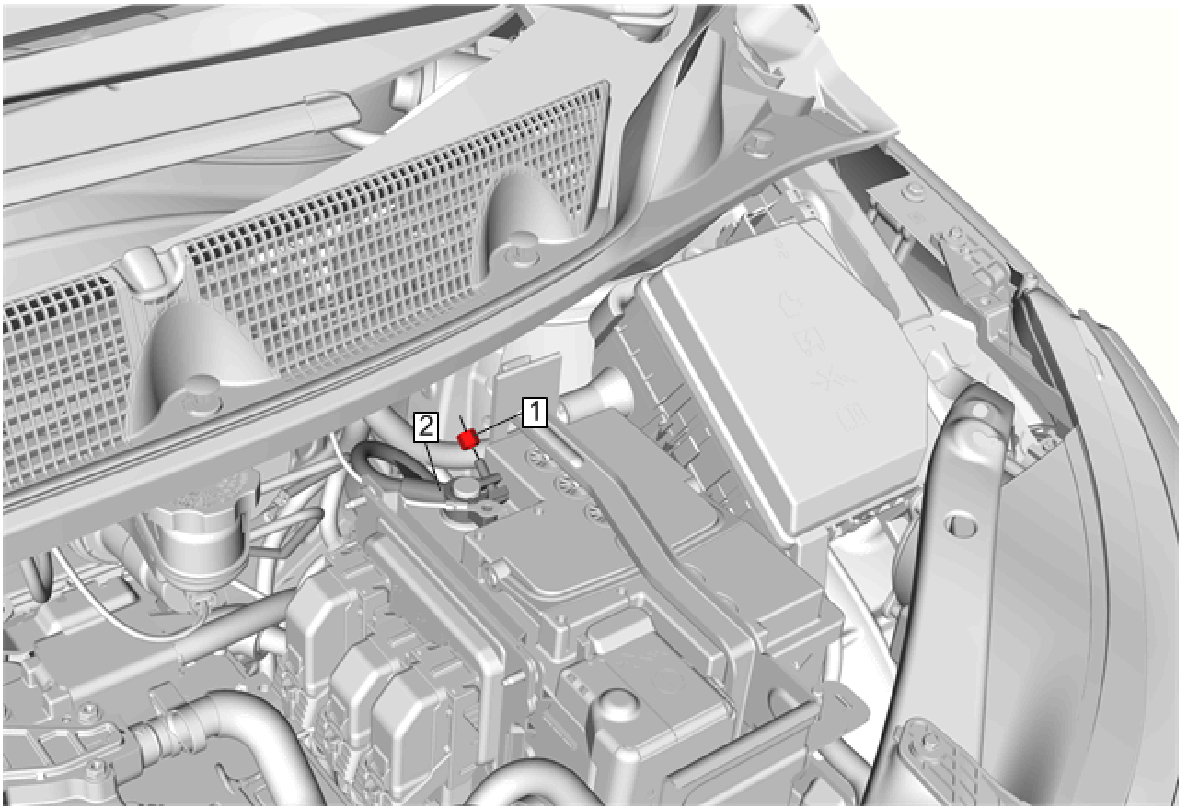

Fig. 2: Battery Negative Cable
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Turn the ignition OFF. 2. Disconnect and remove all 12V battery chargers and the AC charger cable from the hybrid battery charger receptacle.	
1	Battery Negative Cable Fastener **WARNING:** **Refer to Battery Disconnect Warning** **CAUTION:** **Refer to Fastener Caution .** **Tighten** 5 N.m (44 lb in)
2	Battery Negative Cable

BATTERY DISTRIBUTION FUSE BLOCK REPLACEMENT

Removal Procedure

1. Disconnect the battery negative cable. Battery Negative Cable Disconnection and Connection

DESCRIPTION AND OPERATION

BATTERY DESCRIPTION AND OPERATION

300 V Battery

For information about the 355 V hybrid drive motor battery, refer to Drive Motor Battery System Description .

Absorbent Glass Mat Battery

This vehicle is equipped with an absorbent glass mat battery. This is similar to current vehicle lead acid flood batteries, except they use glass mats that absorb electrolytes that are pressed between the plates instead of immersing the plates in electrolytes. This allows a smaller, lighter battery with the same amount of power and is less susceptible to heat.

The maximum permissible voltage allowed for the absorbent glass mat battery is 14.8 V (at room temperature).

12 V Battery

WARNING: **Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:**

- **Always shield your eyes and avoid leaning over the battery whenever possible.**
- **Do not expose the battery to open flames or sparks.**
- **Do not allow the battery electrolyte to contact the eyes or the skin. Flush immediately and thoroughly any contacted areas with water and get medical help.**
- **Follow each step of the jump starting procedure in order.**
- **Treat both the booster and the discharged batteries carefully when using the jumper cables.**

NOTE: **Because of the materials used in the manufacture of automotive lead-acid batteries, dealers and service shops that handle them are subject to various regulations issued by OSHA, EPA, DOT, and various state or local agencies. Other regulations may also apply in other locations. Always know and follow these regulations when handling batteries.**

Batteries that are no longer wanted must be disposed of by an approved battery recycler and must never be thrown in the trash or sent to a landfill.

Batteries that are not part of the vehicle itself, not the battery under the hood, must only be transported on public streets for business purposes via approved hazardous material transportation procedures.

Battery storage, charging and testing facilities in repair shops must meet various requirements for ventilation, safety equipment, material segregation, etc.

The maintenance free battery is standard. There are no vent plugs in the cover. The battery is completely sealed except for 2 small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

Battery Ratings

A battery has 2 ratings:

- Cold cranking amperage
- Amp hours

When a battery is replaced use a battery with similar ratings. Refer to the battery specification label on the original battery.

Amp Hours

The amp hour rating tells you how much amperage is available when discharged evenly over a 20 hour period. The amp hour rating is cumulative, so in order to know how many constant amps the battery will output for 20 hours, you have to divide the amp hour rating by 20. Example: If a battery has an amp hour rating of 74, dividing by 20 = 3.75. Such a battery can carry a 3.75 A load for 20 hours before dropping to 10.5 V. (10.5 V is the fully discharged level, at which point the battery needs to be recharged.) A battery with an amp hour rating of 55 will carry a 2.75 A load for 20 hours before dropping to 10.5 V.

Cold Cranking Amperage

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 seconds at - 18Ã‚Â°C (0Ã‚Â°F) while maintaining at least 7.2 V. Refer to the battery specification label on the original battery for the cold cranking amperage rating for this vehicle.

CHARGING SYSTEM DESCRIPTION AND OPERATION

12 V Battery

The following information is for the 12 V battery only.

For information about charging the high voltage drive motor batteries, refer to **Drive Motor Battery System Description** .

Charging System Operation

The purpose of the charging system is to maintain the battery charge and vehicle loads. The main difference between a conventional generator charging system and this system is that the generator has been replaced by the 14V Power Module. The 14V Power Module provides the power to charge the battery from the high voltage system. There are 7 modes of operation and they include:

- Battery Sulfation Mode
- Normal Mode
- Fuel Economy Mode
- Headlamp Mode
- Voltage Reduction Mode
- Battery Maintenance Mode
- Plant Assembly Mode

C1	C1 Battery
B18	B18 Battery Current Sensor
K20	K20 Engine Control Module
K9	K9 Body Control Module

Charging System Components

14 V Power Module

The 14V Power Module provides the power to charge the battery from the high voltage system. The ECM provides a pulse width charge request signal (L Terminal) to the 14V Power Module. The 14V Power Module returns a PWM feedback signal (F Terminal) to the ECM. The 14V Power Module reports status and fault modes as a function of duty cycle. The 14V Power Module charges the battery based on the ECM signal.

Drive Motor/Generators

The drive motor/generators are serviceable components located within the transmission housing. When the rotors are spun, an alternating current (AC) is induced into the stator windings. This AC voltage is then sent to the drive motor generator power inverter module (PIM) where it is converted to high voltage direct current (DC) power. The output of the PIM is converted into low voltage electrical power by the accessory DC power converter module 14V Power Module for use by the vehicle's electrical system to maintain electrical loads and battery charge.

Body Control Module (BCM)

The body control module (BCM) is a GMLAN device. It communicates with the engine control module (ECM) and the instrument panel cluster for electrical power management operation. The BCM determines the desired voltage set point and sends the information to the engine control module (ECM) which sends this information to the 14V Power Module. The BCM monitors a battery current sensor, the battery positive voltage circuit, and estimated battery temperature to determine battery state of charge.

Battery Current Sensor

The battery current sensor is a serviceable component that is connected to the negative battery cable at the battery. The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the BCM. It creates a 5 V pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0 - 100 percent. Normal duty cycle is between 5 - 95 percent. Between 0 - 5 percent and 95 - 100 percent are for diagnostic purposes.

Engine Control Module (ECM)

The ECM receives control decisions based on messages from the BCM as well as the HPCM2

Instrument Panel Cluster

The instrument panel cluster provides a means of customer notification in case of a failure and a voltmeter. There are 2 means of notification, a charge indicator and a driver information center message of SERVICE BATTERY CHARGING SYSTEM.

Hybrid/EV Powertrain Control Module 2 (HPCM2)

The Hybrid/EV Powertrain control module (HPCM2) is a GMLAN device. It communicates with the engine control module (ECM) to control the voltage set point sent to the 14V Power Module during the battery maintenance mode.

Battery Sulfation Mode

Battery sulfation mode is used to help maintain the battery life. The charging system will enter a battery sulfation mode which tries to increase the vehicle charging when the charging system voltage is less than 13.2 V for about 30 minutes. Once in this mode, the BCM will set a targeted output voltage between 13.9 - 15.5 V for about 5 minutes. Following this 5 minutes, the BCM will then determine which mode to enter depending on the system voltage requirements.

Normal Mode

The BCM will enter Normal Mode whenever one of the following conditions are met.

- The wipers are ON for more than 3 seconds.
- GMLAN Climate Control Voltage Boost Mode Request is true, as sensed by the HVAC control head. High speed cooling fan, rear defogger and HVAC high speed blower operation can cause the BCM to enter the Charge Mode.
- The estimated battery temperature is less than 0Ã‚Â°C (32Ã‚Â°F).
- Vehicle Speed is greater than 145 km/h (90 mph)
- Current Sensor Fault Exists
- System Voltage was determined to be below 12.56 V
- Tow/Haul Mode is enabled

When any one of these conditions is met, the system will set targeted generator output voltage to a charging voltage between 13.9 - 15.5 V, depending on the battery state of charge and estimated battery temperature.

Fuel Economy Mode

The BCM will enter Fuel Economy Mode when the ambient air temperature is at least 0Ã‚Â°C (32Ã‚Â°F) but less than or equal to 80Ã‚Â°C (176Ã‚Â°F), the calculated battery current is greater than -8 A but less than 5 A, and the battery state of charge is greater than or equal to 85 percent. Its targeted 14V Power Module set-point voltage is the open circuit voltage of the battery and can be between 12.6 - 13.2 V. The BCM will exit this mode and enter Normal Mode when any of the conditions described above are present.

Headlamp Mode

The BCM will enter Headlamp Mode whenever the high or low beam headlamps are ON. Voltage will be regulated between 13.9 - 14.5 V.

Voltage Reduction Mode

The BCM will enter Voltage Reduction Mode when the calculated battery temperature is above 0Ã‚Â°C (32Ã‚Â°F) and the calculated battery current is greater than -7 A but less than 1 A. Its targeted 14V Power Module set-point voltage is 12.9 - 13.2 V. The BCM will exit this mode once the criteria are met for Normal Mode.

Battery Maintenance Mode

That battery maintenance mode is designed to ensure the 12V battery has a good state of charge. It accomplishes this by checking the voltage of the 12V battery and providing a charge if needed.

When the vehicle cord is plugged in

- The Hybrid/EV Powertrain control module (HPCM2) will check the 12V battery every 6 hours if the ignition is off. If the voltage is below a temperature dependent threshold ranging from 12.1 (cold) to 12.4 (warm)V, the Hybrid/EV Powertrain control module (HPCM2) will send the voltage set point to the engine control module (ECM). The engine control module (ECM) will send this to the 14V Power Module. Battery maintenance mode will charge the battery for 2-3 hours. If the Ignition is ON, the APM will cycle on as needed to maintain the 12V SOC.

When the vehicle cord is not plugged in

- The Hybrid/EV Powertrain control module (HPCM2) will check the 12V battery every 4 days (2.5 to 3 days) and if the voltage is below a threshold of 12.0 may activate battery maintenance. If the high voltage battery state of charge is greater than 40% and the propulsion system is not active, Hybrid/EV Powertrain control module (HPCM2) will send the voltage set point to the engine control module (ECM). The engine control module (ECM) will send this to the 14V Power Module. Battery maintenance mode will charge the battery for 45-90 minutes..

Plant Assembly Mode

The BCM will increase charging voltage for the first 500 miles of operation in an effort to ensure that the 12 V battery is fully charged when the vehicle is delivered to the customer.

Electrical Power Management Overview

The electrical power management system is designed to monitor and control the charging system and send diagnostic messages to alert the driver of possible problems. This electrical power management system primarily utilizes existing on-board computer capability to maximize the effectiveness of the charging system, manage the load, improve battery state of charge and life, and minimize the system's impact on fuel economy. The electrical power management system performs 3 functions:

- It monitors the battery voltage and estimates the battery condition.
- It takes corrective actions by adjusting the regulated voltage.
- It performs diagnostics and driver notification.

The battery condition is estimated during Vehicle OFF and during Vehicle in Service Mode. During Vehicle OFF the state of charge of the battery is determined by measuring the open-circuit voltage. The state of charge is a function of the acid concentration and the internal resistance of the battery, and is estimated by reading the battery open circuit voltage when the battery has been at rest for several hours.

The state of charge can be used as a diagnostic tool to tell the customer or the dealer the condition of the battery. During Vehicle ON mode, the algorithm continuously estimates state of charge based on adjusted net amp hours, battery capacity, initial state of charge, and temperature.

While running, the battery degree of discharge is primarily determined by a battery current sensor, which is integrated to obtain net amp hours.

In addition, the electrical power management function is designed to perform regulated voltage control to improve battery state of charge, battery life, and fuel economy. This is accomplished by using knowledge of the battery state of charge and temperature to set the charging voltage to an optimum battery voltage level for recharging without detriment to battery life.

Instrument Panel Cluster Operation

Charge Indicator Operation

The instrument panel cluster illuminates the charge indicator and displays a charging system warning message in the driver information center when the one or more of the following occurs:

- The engine control module (ECM) detects system voltage less than 11 V or greater than 16 V. The instrument panel cluster receives a GMLAN message from the ECM requesting illumination.
- The BCM determines that the system voltage is less than 11 V or greater than 16 V.
- The instrument panel cluster receives a GMLAN message from the BCM indicating there is a system voltage range concern.
- The instrument panel cluster performs the displays test at the start of each Vehicle ON cycle. The indicator illuminates for approximately 3 seconds.
- Vehicle ON, with the engine OFF.

Battery Voltage Gauge Operation

The instrument panel cluster displays the system voltage as received from the BCM over the GMLAN serial data circuit. If there is no communication with the BCM then the gauge will indicate minimum.

This vehicle is equipped with a regulated voltage control system. This will cause the voltmeter to fluctuate between 12 - 14 V, as opposed to non-regulated systems which usually maintain a more consistent reading of 14 V. This fluctuation with the regulated voltage control system is normal system operation and NO repairs should be attempted.

SERVICE BATTERY CHARGING SYSTEM

The BCM and the ECM will send a GMLAN message to the driver information center for the SERVICE BATTERY CHARGING SYSTEM message to be displayed. It is displayed whenever the charge indicator is commanded ON due to a failure.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P057B-P057E: BRAKE PEDAL POSITION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P057B

Brake Pedal Position Sensor Performance

DTC P057C

Brake Pedal Position Sensor Circuit Low Voltage

DTC P057D

Brake Pedal Position Sensor Circuit High Voltage

DTC P057E

Brake Pedal Position Sensor Circuit Erratic

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P057C	P057C	P057D	P057B, P057E
5 V Reference	P057C P0651	P057C	P0651	-
Low Reference	-	P057D	P057D	-

Typical Scan Tool Data

Brake Pedal Position Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Vehicle in Service Mode **Normal Range:** 0.25 - 4.75 V			
5 V Reference	0 V	0 V	-
Signal	0 V	0 V	5 V
Low Reference	-	5 V	-

Circuit/System Description

The brake pedal position (BPP) sensor is part of the one pedal driving feature. The engine control module (ECM) continuously monitors the vehicle speed and the position of the brake pedal. These two main inputs, along with other ECM inputs are used to determine if the vehicle is decelerating at the proper speed and rate with the brake pedal applied.

The BPP sensor is a six wire sensor, and is part of a dual brake position sensor. One BPP Sensor is used for the stop lamps and the other BPP Sensor is used for the one pedal driving feature. The BPP Sensor for one pedal driving communicates with the ECM. The ECM supplies a 5 V reference circuit, low reference circuit, and signal circuit to the BPP sensor. The BPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage greater than 0.25 V when the brake pedal is released to a voltage less than 4.75 V when the brake pedal is fully applied.

For information on the Stop Lamps side of the BPP Sensor, refer to **Exterior Lighting Systems Description and Operation** .

Conditions for Running the DTC

P057B

- DTCs P0722, P0723, P077C, P077D, P182E, P1915, U0073, or U0101 are not set.
- Run/Crank voltage is greater than 10 V.
- Shift lever has been in Park at least once during key ON.
- Shift lever is not in Park.
- Vehicle speed is greater than 8 Km/h (5 mph).
- Accelerator Pedal Position is less than 5%.
- DTC runs once per key cycle when above conditions are met.

P057C, P057D, or P057E

Run/Crank voltage is greater than 10 V.

Conditions for Setting the DTC

P057B

ECM detects the BPP sensor signal is stuck in a range for greater than 1 s.

P057C

ECM detects the BPP sensor voltage is less than 0.25 V greater than 1 s.

P057D

ECM detects the BPP sensor voltage is greater than 4.75 V greater than 1 s.

P057E

ECM detects the BPP sensor value varies greater than a calibrated value for 0.50 s.

Action Taken When the DTC Sets

- P057B, P057C, P057D, and P057E are Type A DTCs.
- Cruise control is disabled.

Conditions for Clearing the DTC

P057B, P057C, P057D, and P057E are Type A DTCs

Circuit/System Verification

NOTE: **The Brake Pedal Position sensor scan tool data is located in the ECM automatic transmission data list.**

1. Vehicle in Service Mode.
2. Verify DTC P0641, P0651, P0697, or P06A3 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Transmission in Park, and service brake pedal released.
4. Verify the scan tool Brake Pedal Position Sensor Signal parameter in the ECM displays No.
   - **If Yes is displayed**

Refer to Circuit/System Testing.

- **If No is displayed**

5. Verify the scan tool Brake Pedal Position Sensor Signal parameter changes as the brake pedal is applied and displays Yes on a scan tool when the brake pedal is fully applied.
   - **If Yes is not displayed**

     Refer to Circuit/System Testing.

   - **If Yes is displayed**
6. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor. It may take up to 2 minutes for all vehicle systems to power down.

NOTE: **All terminal references are for the vehicle harness brake pedal position sensor connector.**

2. Test for less than 10 Ω between the low reference circuit terminal 6 and ground.
   - **If 10 Ω or greater**
     1. Disconnect the harness connector at the K20 Engine Control Module.
     2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 5 and ground.
   - **If less than 4.8 V**
     1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
     2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
     3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If greater than 5.2 V**
     1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle ON.
     2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
   - **If between 4.8 - 5.2 V**
5. Verify the scan tool Brake Pedal Position Sensor Signal parameter is released.
   - **If released is not displayed**
     1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle ON.
     2. Test for less than 0.25 V between the signal circuit terminal 4 and ground.
        - If 0.25 V or greater, repair the short to voltage on the circuit.
        - If less than 0.25 V, replace the K20 Engine Control Module.
   - **If released is displayed**
6. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 5.
7. Verify the scan tool Brake Pedal Position Sensor parameter is applied.

    - **If applied is not displayed**
        1. Vehicle OFF, remove the jumper wire, and disconnect the harness connector at the K20 Engine Control Module.
        2. Test for infinite resistance between the signal circuit terminal 4 and ground.
            - If less than infinite resistance, repair the short to ground on the circuit.
            - If infinite resistance.
        3. Test for less than 2 Ω in the signal circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K20 Engine Control Module.
            - **If applied is displayed**

8. Replace the B22 Brake Pedal Position Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Brake Pedal Position Sensor Replacement**
- Perform the **Brake Pedal Position Sensor Calibration** following the replacement of the ECM or BPP sensor, or any repair that effects the BPP sensor alignment.
- Refer to **Control Module References** for Engine Control Module replacement, programming and setup.

DTC P0601-P0604, P0606, OR P062F: CONTROL MODULE (HYBRID POWERTRAIN CONTROL MODULE 1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0601

Control Module Read Only Memory Performance

DTC P0602

Control Module Not Programmed

DTC P0603

Control Module Long Term Memory Reset

DTC P0604

Control Module Random Access Memory Performance

DTC P0606

Control Module Processor Performance

DTC P062F

Control Module Long Term Memory Performance

Circuit/System Description

This is an internal fault detection of the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

P0601 - P0604, and P0606

The vehicle is ON.

P062F

This diagnostic is executed at system power-up; both at vehicle ON and at the start of a plug in charging event.

Conditions for Setting the DTC

P0601 - P0604, P0606, and P062F

The control module has detected an internal malfunction or a service module has been installed but not yet programmed.

Action Taken When the DTC Sets

- P0601 - P0604 and P0606 are Type A DTCs.
- P062F is a Type B DTC.
- P0601, P0602, P0604, and P0606 propulsion will be disabled.

Conditions for Clearing the DTC

- P0601 - P0604 and P0606 are Type A DTCs.
- P062F is a Type B DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0562 is not set.
    - **If the DTC is set**

      Refer to **DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C, P1A0D, or P1EFC** .

    - **If the DTC is not set**
3. Verify DTC P0602 is not set.
    - **If the DTC is set**
    1. Verify the K114A Hybrid Powertrain Control Module has the latest calibration in Calibration Information.
        - If the K114A Hybrid Powertrain Control Module does not have the latest calibration, program the K114A Hybrid Powertrain Control Module.
        - If the K114A Hybrid Powertrain Control Module has the latest calibration, replace the T6 Power Inverter Module.
    2. Verify the DTC does not set.
        - If the DTC is set, replace the T6 Power Inverter Module.
        - If the DTC does not set
4. All OK.
    - **If the DTC is not set**
5. Verify DTC P0601, P0603, P0604, P0606, or P062F is not set.
    - **If the DTC P0601, P0603, P0604, P0606, or P062F is set**

      Replace the T6 Power Inverter Module.

- **If the DTC is not set**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0601-P0604, P0606, P062F, P0630, P16F3, OR P262B: CONTROL MODULE (ECM)

Diagnostic Instructions

- Preform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC P0630

VIN Not Programmed or Mismatched - Engine Control Module (ECM)

DTC P16F3

Control Module Redundant Memory Performance

DTC P262B

Control Module Power Off Timer Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). This diagnostic also addresses if the ECM is not programmed.

The ECM monitors its ability to read and write to the memory. It also monitors a timing function.

Conditions for Running the DTC

P0601, P0602, P0630, P16F3

- The vehicle is ON.
- These DTCs run continuously when the above condition is met.

P0603, P062F

- The vehicle is ON.
- These DTCs run once per ignition cycle.

P0604

- The vehicle is ON.
- DTC P0604 runs continuously when the above condition is met.

P0606

- The system voltage is greater than 11 V.
- DTC P0606 runs continuously when the above condition is met.

P262B

- Vehicle OFF.
- The ECM is not powered down.
- DTC P262B runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects an internal failure or incomplete programming.

Action Taken When the DTC Sets

- DTCs P0601, P0602, P0603, P0604, P0606, P0630, and P16F3 are Type A DTCs.
- DTCs P062F and P262B is a Type B DTC.

Conditions for Clearing the DTC

- DTCs P0601, P0602, P0603, P0604, P0606, P0630, and P16F3 are Type A DTCs.
- DTCs P062F and P262B is a Type B DTC.

Diagnostic Aids

Low voltage or a momentary loss of power or ground to the ECM may cause a DTC to set. Verify the following:

- The battery cables are clean and tight, and the battery is fully charged. Refer to **Battery Inspection/Test**
- The ECM ground circuits do not have an open or high resistance.
- The ECM power circuits do not have an open, short to ground, or high resistance.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0602 or P0630 is not set.
    - **If the DTC is set**
    1. Verify the K20 ECM has the latest calibration in Calibration Information.
        - If the K20 ECM does not have the latest calibration, program the K20 ECM.
        - If the K20 ECM has the latest calibration, replace the K20 ECM.
    2. Verify the DTC does not set.
        - If the DTC sets, replace the K20 ECM.
        - If the DTC does not set
    3. All OK.
    - **If the DTC is not set**
3. Verify DTC P0601, P0603, P0604, P0606, P062F, P16F3 or P262B is not set.
    - **If DTC P0601, P0603, P0604, P0606, P062F, P16F3 or P262B is set**

      Replace the K20 ECM.

    - **If the DTC is not set**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for ECM replacement, programming and setup.

DTC P061B: CONTROL MODULE TORQUE CALCULATION PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC P061B

Control Module Torque Calculation Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor monitors the data to verify that the indicated axle torque requested calculation is correct.

Conditions for Running the DTC

- Vehicle is ON.
- The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P061B is a Type A DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

DTC P061B is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P061B is not set.
    - **If the DTC is set**

      Replace the T6 Power Inverter Module.

    - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as Drive Motor Generator Power Inverter Module, replacement, setup, and programming.

DTC P0641, P0651, P0697, OR P06A3: 5 V REFERENCE 1-4 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0641

5 V Reference 1 Circuit

DTC P0651

5 V Reference 2 Circuit

DTC P0697

5 V Reference 3 Circuit

DTC P06A3

5 V Reference 4 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference 1	P0641	P0641	P0641	P0641
5 V Reference 2	P0651	P0651	P0651	P0651
5 V Reference 3	P0697	P0697	P0697	P0697
5 V Reference 4	P06A3	P06A3	P06A3	P06A3

Circuit/System Description

The ECM has four internal 5 V reference circuits. Each 5 V internal reference circuit provides a 5 V bias voltage to the sensor it is connected to. An open, short to ground, or short to voltage on one external 5 V reference circuit can affect the component it is connected to.

Conditions for Running the DTC

DTCs P0641, P0651, P0697, and P06A3 run continuously when the Run/Crank Voltage is greater than 6.4 V for greater than 2 s.

Conditions for Setting the DTC

The ECM detects the 5 V reference 1, 2, 3, or 4 circuit is not 4.8 - 5.2 V for 0.2 s.

Action Taken When the DTC Sets

DTCs P0641, P0651, P0697, and P06A3 are Type A DTCs.

P0641

Air conditioning is disabled.

P0651

Regenerative braking is disabled.

P0697 and P06A3

- Reduced performance.
- No creep or hill hold torque when the brake pedal is released.

Conditions for Clearing the DTC

DTCs P0641, P0651, P0697, and P06A3 are Type A DTCs.

Diagnostic Aids

P0641

The 5 V reference 1 circuit provides 5 V to the A/C Refrigerant Pressure Sensor.

P0651

The 5 V reference 2 circuit provides 5 V to the Brake Pedal Switch Position Sensor.

P0697

The 5 V reference 3 circuit provides 5 V to the Accelerator Pedal Position Sensor 2.

P06A3

The 5 V reference 4 circuit provides 5 V to the Accelerator Pedal Position Sensor 1.

It may be possible to locate the fault by disconnecting one component at a time from the appropriate 5 V reference circuit while viewing the corresponding 5-volt Reference 1, 3, 4 Circuit Status parameter on the scan tool. The scan tool parameter will change from Malfunction to OK when the source of the fault is disconnected. If all 5 V reference components have been disconnected and a fault is still indicated, the fault may exist in the wiring harness.

Circuit/System Verification

1. Verify the scan tool parameters listed below display OK:
    - 5 V Reference 1 Circuit Status
    - 5 V Reference 2 Circuit Status
    - 5 V Reference 3 Circuit Status
    - 5 V Reference 4 Circuit Status
    - **If not OK**

      Refer to Circuit/System Testing.

    - **If OK**
2. Verify the scan tool parameters listed below display 4.8 - 5.2 V:
    - 5 V Reference 1
    - 5 V Reference 2
    - 5 V Reference 3
    - 5 V Reference 4
    - **If not between 4.8 - 5.2 V**

      Refer to Circuit/System Testing.

    - **If between 4.8-5.2 V**
3. All OK.

Circuit/System Testing

NOTE: **Additional DTCs will set when disconnecting components.**

1. Vehicle in Service Mode.

2. Test for 4.8 - 5.2 V between the 5 V reference circuit terminals listed below and ground:
    - B107 Accelerator Pedal Position Sensor terminal 1
    - B107 Accelerator Pedal Position Sensor terminal 6
    - B22 Brake Pedal Position Sensor terminal 5.
    - B1 A/C Refrigerant Pressure Sensor terminal 2
    - **If less than 4.8 V**
    1. Vehicle Off, disconnect the harness connector at the K20 ECM.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 ECM.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the harness connector at the K20 ECM, vehicle ON.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 ECM.
    - **If between 4.8 - 5.2 V**
3. Replace the appropriate sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Accelerator Pedal Assembly Replacement** for B107 Accelerator Pedal Position Sensor replacement.
- Refer to **Air Conditioning Refrigerant Pressure Sensor Replacement - High Pressure**
- Refer to **Brake and Accelerator Pedal Assembly Replacement** for B201 Brake Control Brake Pedal Position Sensor replacement.
- Refer to **Brake Pedal Position Sensor Replacement**
- Refer to **Control Module References** for K20 ECM replacement, programming, and setup.

DTC P0650, P263A, OR P263B: MALFUNCTION INDICATOR LAMP (MIL) CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0650

Malfunction Indicator Lamp (MIL) Control Circuit

DTC P263A

Malfunction Indicator Lamp (MIL) Control Circuit Low Voltage

DTC P263B

Malfunction Indicator Lamp (MIL) Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0650	P0650	-	-
MIL Control	P0650, P263A*	P0650, P263A	P263B	-
* The MIL remains ON				

Circuit/System Description

The MIL illuminates to inform the driver that a fault has occurred and a vehicle system requires service. Ignition voltage is supplied directly to the MIL and, when a fault occurs, the ECM turns the MIL ON by grounding the MIL control circuit. Under normal operating conditions, the MIL should be ON only during bulb check.

Conditions for Running the DTC

Remote Vehicle Start is not active.

P0650

Ignition voltage is greater than 11 V.

P263A and P263B

Run/Crank Voltage is greater than 11 V.

Conditions for Setting the DTC

P0650

The ECM detects low voltage during the MIL control circuit driver OFF state.

P263A

The ECM detects low voltage during the MIL control circuit driver OFF state.

P263B

The ECM detects high voltage on the MIL control circuit during the driver ON state.

Action Taken When the DTC Sets

- DTC P0650, P263A, and P263B are Type B DTCs.
- No MIL illumination.

Conditions for Clearing the DTC

DTC P0650, P263A, and P263B are Type B DTCs.

Diagnostic Aids

- If the condition is intermittent, move the related harnesses and connectors with the vehicle ON while monitoring the scan tool MIL control circuit status parameters. The MIL control circuit status parameters will change from OK or Not Run to Fault if there is a condition with the circuit or a connection.
- If the ECM detects low voltage on the MIL control circuit during the MIL control circuit driver OFF state, DTCs P0650 and DTC P263A may set simultaneously.

Circuit/System Verification

1. Vehicle ON, command the malfunction indicator lamp ON and OFF with a scan tool.
2. Verify that the malfunction indicator lamp turns ON and OFF as commanded.
    - **If the malfunction indicator lamp does not turn ON and OFF as commanded**

      Refer to Circuit/System Testing.

    - **If the malfunction indicator lamp turns ON and OFF as commanded**
3. Vehicle ON, command the malfunction indicator lamp ON and OFF with a scan tool.
4. Verify that the control circuit status parameters listed below display OK or Not Run:
    - MIL Control Circuit Low Voltage Test Status
    - MIL Control Circuit Open Test Status
    - MIL Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing.

    - **If OK or Not Run is displayed**
5. Vehicle ON, command the malfunction indicator lamp ON and OFF with a scan tool.
6. Verify that the control circuit status parameters listed below display OK or Not Run:
    - MIL Control Circuit Low Voltage Test Status
    - MIL Control Circuit Open Test Status
    - MIL Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing.

    - **If OK or Not Run is displayed**
7. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
    - **If any DTC sets**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

    - **If a DTC does not set**
8. All OK.

Circuit/System Testing

1. Vehicle OFF.
2. Disconnect the X1 harness connector at the K20 ECM.
3. Vehicle in Service Mode, verify the malfunction indicator lamp does not illuminate.
    - **If the malfunction indicator lamp illuminates**

    1. Test for infinite resistance between the malfunction indicator lamp control circuit X1 terminal 12 and ground.
        - If less than infinite resistance, repair the short to ground in the circuit end to end.
        - If infinite resistance
    2. Replace the P16 instrument cluster.
    - **If the malfunction indicator lamp does not illuminate**
4. Connect a 3 A fused jumper wire between the malfunction indicator lamp control circuit X1 terminal 12 and ground.
5. Verify the malfunction indicator lamp illuminates.
    - **If the malfunction indicator lamp does not illuminate**
    1. Test the malfunction indicator lamp control circuit X1 terminal 12 for a short to voltage or an open/high resistance end to end.
        - If the malfunction indicator lamp control circuit X1 terminal 12 is shorted to voltage or has an open/high resistance, repair as necessary.
        - If the malfunction indicator lamp control circuit X1 terminal 12 tests normal
    2. Test the instrument cluster ignition voltage circuit for a short to ground or open/high resistance end to end.
        - If the instrument cluster ignition voltage circuit is shorted to ground or has an open/high resistance, repair as necessary.
        - If the instrument cluster ignition voltage circuit tests normal
    3. Replace the P16 instrument panel cluster.
    - **If the malfunction indicator lamp illuminates**
6. Replace the K20 ECM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Instrument Cluster Replacement**
- Refer to **Control Module References** for K20 ECM replacement, programming, and setup.

DTC P0685-P0687, P0689, P0690, OR P1682: ENGINE CONTROLS IGNITION RELAY/IGNITION 1 SWITCH CIRCUIT 2

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

*Internal control module or component damage may occur if the circuit shorts to B+.				

Circuit/System Description

Circuit	Description
B+ - Relay Coil	Supplied directly from the battery.
B+ - Relay Switch	Supplied directly from the battery.
Control - Component	The output circuit is switched to 12 V to activate the component.
Control - Relay Coil	The output circuit is switched to ground to activate the component.

Components

Component	Description
KR75 Engine Controls Ignition Relay	Relays are used to control a high power circuit with a low power signal.
K20 Engine Control Module	The control module controls a series of actuators to ensure optimal system performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the actuators accordingly.

4 ignition voltage circuits supply the ECM. The 4 circuits are supplied by 2 relay(s):

- KR73 Ignition Main Relay
- KR75 Engine Controls Ignition Relay

The ECM monitors and compares the voltages supplied by the relay(s).

Conditions for Running the DTC

P0685, P0686

- Run/Crank voltage is greater than 5 V.
- System voltage is greater than 11 V.
- Run/Crank voltage is greater than 5 V.

THEN

- Less than 5 V for 5 s.

P0687

- Run/Crank voltage is greater than 5 V.
- System voltage is greater than 11 V.

P0689, P0690

- DTCs P0685, P0686, or P0687 are not set.
- Ignition voltage is greater than 11 V.
- Engine Controls Ignition Relay Command is On.

P1682

- Engine Controls Ignition Relay is commanded On.
- Ignition voltage is greater than 5 V.
- Run/Crank voltage is greater than 5.5 V.

Conditions for Setting the DTC

P0685, P0686, P0687

The commanded state of the driver and the actual state of the control circuit do not match for greater than 2 s.

P0689

Engine Controls Ignition Relay Feedback Circuit is less than 5 V for greater than 5 s.

P0690

Engine Controls Ignition Relay Feedback Circuit is greater than 4 V for greater than 5 s.

P1682

The following parameters are not within 3 V of each other:

- Run/Crank Voltage
- Engine Controls Ignition Relay Voltage

Actions Taken When the DTC Sets

DTCs P0685, P0686, P0687, P0689, P0690, and P1682 are Type C DTCs.

Conditions for Clearing the DTC

DTCs P0685, P0686, P0687, P0689, P0690, and P1682 are Type C DTCs.

Diagnostic Aids

If the condition is intermittent, wiggle the related wiring harnesses and connectors, with the ignition/vehicle on or engine running, while monitoring the scan tool circuit status parameters for the component. The parameters will display if there is a condition with the circuit or a connection.

    - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Vehicle Off.
2. Remove the component: KR75 Engine Controls Ignition Relay
3. Verify a test lamp turns On between the test points:

  - B+ circuit terminal 30 & Ground
  - B+ circuit terminal 85 & Ground
  - **If the test lamp does not turn On**

    Replace the component: X50A Fuse Block - Underhood

  - **If the test lamp turns On**

4. Ignition - On/Vehicle - In Service Mode
5. Connect a test lamp between the test points: Control circuit terminal 86 & B+ circuit
6. Perform the scan tool control function: KR75 Engine Controls Ignition Relay - On and Off

   Verify the test lamp turns On and Off.

   - **If the test lamp is always Off**
   1. Ignition/Vehicle - Off & Remove - Test lamp
   2. Disconnect the electrical connector: X1 @ K20 Engine Control Module
   3. Ignition - On/Vehicle - In Service Mode
   4. Test for less than 1 V between the test points: Control circuit terminal 86 @ Relay Socket & Terminal 67 @ Control module harness
      - If 1 V or greater - Repair the short to voltage on the circuit.
      - If less than 1 V
   5. Ignition/Vehicle - Off
   6. Test for less than 2 ohms between the test points: Control circuit terminal 86 @ Relay Socket & Terminal 67 @ Control module harness
      - If 2 ohms or greater - Repair the open/high resistance in the circuit.
      - If less than 2 ohms - Replace the component: K20 Engine Control Module
   - **If the test lamp is always On**
   1. Ignition/Vehicle - Off & Remove - Test lamp
   2. Disconnect the electrical connector: X1 @ K20 Engine Control Module
   3. Test for infinite resistance between the test points: Control circuit terminal 86 @ Relay Socket & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: K20 Engine Control Module
   - **If the test lamp turns On and Off**
7. Verify the fuse is not open: F66UA Fuse
   - **If the fuse is open**
   1. Vehicle Off.
   2. Disconnect the electrical connector: X1 @ K20 Engine Control Module
   3. Test for infinite resistance between the test points: Output terminal @ Fuse & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: K20 Engine Control Module
   - **If the fuse is not open**
8. Ignition - On/Vehicle - In Service Mode
9. Verify a test lamp does not turn On between the test points: KR75 Engine Controls Ignition Relay Terminal 87 & Ground
   - **If the test lamp turns On**
10. Disconnect the electrical connector: X1 @ K20 Engine Control Module
11. Test for less than 1 V between the test points:
    - Control circuit X1 terminal 29 @ Control module harness & Ground
    - Switch circuit X1 terminal 16 @ Control module harness & Ground
    - If 1 V or greater - Repair the short to voltage on the circuit.
    - **If the test lamp does not turn On**
12. Vehicle Off.

13. Connect a 30 A fused jumper wire between the test points: Control circuit terminal 87 & B+ circuit terminal 30
14. Ignition - On/Vehicle - In Service Mode
15. Verify the scan tool parameter: Engine Controls Ignition Relay Feedback Signal = Within 1 V of the battery voltage
    - **If not within 1 V of the battery voltage**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector: X1 @ K20 Engine Control Module
    3. Test for less than 2 ohms between the test points:
        - Control circuit terminal 87 @ Relay Socket & Control circuit terminal 29 @ Control module harness
        - Control circuit terminal 87 @ Relay Socket & Control circuit terminal 16 @ Control module harness
        - If 2 ohms or greater - Repair the open/high resistance in the circuit.
        - If less than 2 ohms - Replace the component: K20 Engine Control Module
    - **If within 1 V of the battery voltage**
16. Test or replace the component: KR75 Engine Controls Ignition Relay

Component Testing

Relay Test

1. Vehicle Off.
2. Remove the component: KR75 Engine Controls Ignition Relay
3. Test for 70 to 110 ohms between the test points: Component terminal 85 & 86
    - **If not between 70 and 110 ohms**

      Replace the component: KR75 Engine Controls Ignition Relay

    - **If between 70 and 110 ohms**
4. Test for infinite resistance between the test points:
    - Component terminal 30 & 85
    - Component terminal 30 & 86
    - Component terminal 30 & 87
    - Component terminal 85 & 87
    - **If less than infinite resistance**

      Replace the component: KR75 Engine Controls Ignition Relay

    - **If infinite resistance**
5. Connect a 3 A fused jumper wire between the test points: Component terminal 86 & B+

   Connect a jumper wire between the test points: Component terminal 85 & Ground

6. Test for less than 2 ohms between the test points: Component terminal 30 & 87
    - **If 2 ohms or greater**

      Replace the component: KR75 Engine Controls Ignition Relay

    - **If less than 2 ohms**
7. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

Refer to **Control Module References** for control module replacement, programming, and setup.

DTC P06AF: TORQUE MANAGEMENT SYSTEM PERFORMANCE - FORCED ENGINE SHUTDOWN

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P06AF

Torque Management System Performance - Forced Engine Shutdown

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors a state of health message that the ECM transmits to verify the ECM is functioning properly. The hybrid/EV powertrain control module 1 is part of the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

- The system voltage is greater than 9.5 V.
- Vehicle is Run Crank Active for more than 0.1 s.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 1 does not detect a valid state of health message from the ECM.

Action Taken When the DTC Sets

- DTC P06AF is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P06AF is a Type A DTC.

Circuit/System Verification

1. Vehicle ON.
2. Verify ECM DTC P0606 is not set.
    - **If the DTC is set**

      Refer to **DTC P0601-P0604, P0606, P062F, P0630, P16F3, or P262B (ECM)**.
    - **If the DTC is not set**
3. Verify DTC P06AF is not set.
    - **If the DTC is set**
    1. Replace the K20 Engine Control Module.
    2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
    3. Verify the DTC does not set.
        - If the DTC is set
        1. Verify the K114A Hybrid Powertrain Control Module has the latest calibration in Calibration Information.
            - If the K114A Hybrid Powertrain Control Module does not have the latest calibration, program the K114A Hybrid Powertrain Control Module.
            - If the K114A Hybrid Powertrain Control Module has the latest calibration, replace the T6 Power Inverter Module.
        2. Verify the DTC does not set.
            - If the DTC sets, replace the T6 Power Inverter Module.
            - If the DTC does not set
        3. All OK.
        - If the DTC is not set
    4. All OK.
    - **If the DTC is not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K20 ECM or T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, setup, and programming.

DTC P06B1 OR P06B2: SENSOR SUPPLY VOLTAGE CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P06B1

Sensor Supply Voltage Circuit Low Voltage

DTC P06B2

Sensor Supply Voltage Circuit High Voltage

Circuit/System Description

The motor control module shares an internal 15 V reference power supply in order to operate the drive motor. This fault is handled inside the power inverter module, often referred to as the drive motor generator power inverter module, and no external circuits are involved. The control modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid/EV powertrain control module 1
- Drive motor control module

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is greater than 9.5 V.

  OR

- The controller is Awake.
- The system voltage is greater than 10.50 V AND less than 11.0 V.

Conditions for Setting the DTC

P06B1

The reference voltage is less than 8.4 V.

P06B2

The reference voltage is greater than 15.6 V.

Action Taken When the DTC Sets

P06B1 and P06B2 are Type B DTCs.

Conditions for Clearing the DTC

P06B1 and P06B2 are Type B DTCs.

Diagnostic Aids

Low voltage or a momentary loss of power or ground to the hybrid/EV powertrain control module 1 may cause a DTC to set. Verify the following:

- The battery cables are clean and tight, and the battery is fully charged. Refer to **Battery Inspection/Test** .
- The hybrid/EV powertrain control module 1 ground circuits do not have an open or high resistance.
- The hybrid/EV powertrain control module 1 power circuits do not have an open, short to ground, or high resistance.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0562 is not set.
    - **If the DTC is set**

      Refer to **DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C, P1A0D, or P1EFC** .

    - **If the DTC is not set**
3. Verify DTC P06B1, P06B2, P06E7 or P06E8 is not set.
    - **If any of the DTCs are set**
    1. Verify the DTC does not set.
        - If the DTC sets, replace the T6 Power Inverter Module.

- If the DTC does not set.

2. All OK.

- **If none of the DTCs are set**

4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, OR P1B03: DRIVE MOTOR POSITION SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

*Represents a differential circuit consisting of a pair of wires. See Circuit/System Description and schematic for detailed description.				

Circuit/System Description

The drive motor position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils, and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor. At vehicle ON, the motor control module outputs a 4.2 V AC, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for return signals - Sine and Cosine waveforms, often referred to as SIN and COS. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coil signals allows the motor control module to determine the exact position, speed and direction of the drive motor rotor.

Conditions for Running the DTC

P0A3F, P0A40, or P1B03

The drive motor is operating.

P0C52, P0C53, P0C5C, or P0C5D

The vehicle is ON.

Conditions for Setting the DTC

P0C52, P0C5C

Circuit voltage is less than 0.5 V.

P0C53, P0C5D

Circuit voltage is greater than 4.5 V.

P0A3F

SIN or COS signal is less than 2.3 V. The motor control module cannot determine the motor position based upon the sensor signals.

P0A40

SIN or COS signal is greater than 4 V. The motor control module detects a degraded motor position sensor signal.

P1B03

The motor control module is unable to track the motor position based upon the sensor signals.

Action Taken When the DTC Sets

- DTCs P0A3F, P0A40 and P1B03 are Type A DTCs.
- DTCs P0C52, P0C53, P0C5C, and P0C5D are Type B DTCs.

Conditions for Clearing the DTC

- DTCs P0A3F, P0A40 and P1B03 are Type A DTCs.
- DTCs P0C52, P0C53, P0C5C, and P0C5D are Type B DTCs.

Diagnostic Aids

- The drive motor position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, corrosion, and terminal damage. Extreme care must be taken when probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.
- If the customer comments that the problem occurs only during moist environmental conditions: rain, snow, vehicle wash, etc., inspect the sensor wiring for signs of water intrusion.
- The sensor circuit loops are a twisted pair with each pair covered in a foil shield. The shield circuits outside of the transmission are grounded to a stud on the power inverter module, often referred to as the drive motor generator power inverter module.
- The drive motor position sensor harness circuits are shielded. Improperly grounded shield circuits may cause inaccurate sensor signals.

Special Tools

DT-52010 Jumper Harness (12 Pins)

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Testing

NOTE: **You must perform the Component Testing before proceeding with Circuit/System Testing.**

1. Vehicle OFF, disconnect the X2 harness connector at the T12 Automatic Transmission Assembly.
2. Install the **DT-52010** harness to the vehicle harness side only.
3. Vehicle ON.
4. Test for 0.8 - 1.4 V between the signal circuit terminals listed below and ground:
    - Signal (COS) circuit terminal 5
    - Signal (COS) circuit terminal 4
    - Signal (SIN) circuit terminal 8
    - Signal (SIN) circuit terminal 9
    - **If less than 0.8 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify proper terminal contact and if OK replace the T6 Power Inverter Module.
    - **If greater than 1.4 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module, Vehicle ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the T6 Power Inverter Module.

- **If between 0.8 - 1.4 V**

NOTE: **Switch DMM setting to measure AC voltage for this step.**

5. Test for 3 - 4.5 V AC between the reference circuit terminals listed below:
    - Terminal 6
    - Terminal 7
    - **If less than 3 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
    2. Test for infinite resistance between EACH reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in EACH reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify proper terminal contact and if OK replace the T6 Power Inverter Module.
    - **If greater than 4.5 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module, Vehicle ON.
    2. Test for less than 1 V between EACH reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the T6 Power Inverter Module.
    - **If between 3 - 4.5 V**
6. All OK.

Component Testing

NOTE: **If the a/trans wiring harness assembly circuits fail the circuit tests, replace the harness; do not repair.**

1. Vehicle ON.
2. Verify that DTC P1AF0, P1B44, P1E1E, P1E22, P1B0B, or P1B0C is not set.
    - **If any of the DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If none of the DTCs are set**
3. Vehicle OFF, disconnect the X2 harness connector at the T12 Automatic Transmission Assembly.
4. Install the **DT-52010** jumper harness to the transmission side only.
5. Test for 5 - 20 Ω between the reference circuit terminal 6 and the reference circuit terminal 7.
    - **If less than 5 Ω**
    1. Disconnect the X1 harness connector at the M15 Drive Motor.
    2. Test for infinite resistance between the reference circuit terminal 6 and the reference circuit terminal 7.
        - If less than infinite resistance, replace the a/trans wiring harness assembly.
        - If infinite resistance, replace the B228 Drive Motor Position Sensor.
    - **If greater than 20 Ω**
    1. Disconnect the X1 harness connector at the M15 Drive Motor.
    2. Test for less than 2 Ω in the reference circuits end to end.
        - If 2 Ω or greater, replace the a/trans wiring harness assembly.
        - If less than 2 Ω, replace the B228 Drive Motor Position Sensor.
    - **If between 5 - 20 Ω**
6. Test for 15 - 30 Ω between the signal (COS) circuit terminal 5 and the signal (COS) circuit terminal 4.
    - **If less than 15 Ω**
    1. Disconnect the X1 harness connector at the M15 Drive Motor.

    2. Test for infinite resistance between the signal (COS) circuit terminal 5 and the signal (COS) circuit terminal 4.
        - If less than infinite resistance, replace the a/trans wiring harness assembly.
        - If infinite resistance, replace the B228 Drive Motor Position Sensor.
    - **If greater than 30 Ω**
    1. Disconnect the X1 harness connector at the M15 Drive Motor.
    2. Test for less than 2 Ω in the signal circuits end to end.
        - If 2 Ω or greater, replace the a/trans wiring harness assembly.
        - If less than 2 Ω, replace the B228 Drive Motor Position Sensor.
    - **If between 15 - 30 Ω**
7. Test for 15 - 30 Ω between the signal (SIN) circuit terminal 8 and the signal (SIN) circuit terminal 9.
    - **If less than 15 Ω**
    1. Disconnect the X1 harness connector at the M15 Drive Motor.
    2. Test for infinite resistance between the signal (SIN) circuit terminal 8 and the signal (SIN) circuit terminal 9.
        - If less than infinite resistance, replace the a/trans wiring harness assembly.
        - If infinite resistance, replace the B228 Drive Motor Position Sensor.
    - **If greater than 30 Ω**
    1. Disconnect the X1 harness connector at the M15 Drive Motor.
    2. Test for less than 2 Ω in the signal circuits end to end.
        - If 2 Ω or greater, replace the a/trans wiring harness assembly.
        - If less than 2 Ω, replace the B228 Drive Motor Position Sensor.
    - **If between 15 - 30 Ω**
8. Test for greater than 10,000 Ω between the terminals listed below and ground:
    - Reference terminal 6
    - Reference terminal 7
    - Signal (COS) circuit terminal 5
    - Signal (COS) circuit terminal 4
    - Signal (SIN) circuit terminal 8
    - Signal (SIN) circuit terminal 9
    - **If less than 10,000 Ω**
    1. Disconnect the X1 harness connector at the M15 Drive Motor.
    2. Test for less than infinite resistance between the appropriate terminal and ground.
        - If less than infinite resistance, replace the a/trans wiring harness assembly.
        - If infinite resistance, replace the B228 Drive Motor Position Sensor.
    - **If 10,000 Ω or greater**
9. Test for infinite resistance between the terminals listed below:
    - Terminals 9 and 4
    - Terminals 9 and 7
    - Terminals 8 and 6
    - **If less than infinite resistance**
    1. Disconnect the X1 harness connector at the M15 Drive Motor.
    2. Test for less than infinite resistance between the appropriate terminals.
        - If less than infinite resistance, replace the a/trans wiring harness assembly.
        - If infinite resistance, replace the B228 Drive Motor Position Sensor.
    - **If infinite resistance**
10. Refer to Circuit/System Testing.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Automatic Transmission Control Wiring Harness Removal - Transmission Case Cover** , or **Drive Motor Position Sensor Stator Removal** for A/Trans Wiring Harness Assembly or B228 Drive Motor Position Sensor replacement.

DTC P0A5E, P0A61, OR P0A64: DRIVE MOTOR PHASE U/V/W LOW CURRENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0A5E

Drive Motor Phase U Low Current

DTC P0A61

Drive Motor Phase V Low Current

DTC P0A64

Drive Motor Phase W Low Current

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the drive motor generator power inverter module and no external circuits are involved.

The control modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid/EV powertrain control module 1
- Drive motor control module

Conditions for Running the DTC

- DTCs P0BE6, P0BE7, P0BE8, P0BEA, P0BEB, P0BEC, P0BEE, P0BEF, P0BF0 are not set.
- The control module runs the program to detect an internal fault when the Hybrid wake-up circuit is active.

Conditions for Setting the DTC

The control module has detected a malfunction.

Action Taken When the DTC Sets

- DTCs P0A5E, P0A61, and P0A64 are Type A DTCs.
- The power inverter module requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P0A5E, P0A61, and P0A64 are Type A DTCs.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0A5E, P0A61, and P0A64 is not set.

- **If any of the DTCs are set**

3. Verify the DTC does not set. If the DTC sets, replace the T6 Power Inverter Module.
    - **If the DTC does not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0A78: DRIVE MOTOR INVERTER PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0A78

Drive Motor Inverter Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the drive motor control module. The motor control module operates the drive motor based upon hybrid/EV powertrain control module 1 commands. The motor control module controls the speed, direction and output torque of the drive motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each insulated gate bipolar transistor assembly is monitored for fault conditions. The motor control module is part of the power inverter module and are not serviced separately.

Conditions for Running the DTC

- The high voltage contactor relays are closed.
- High voltage greater than 100 V.

Conditions for Setting the DTC

The motor control module detects excessive current flow through the switched portion of the insulated gate bipolar transistor.

Action Taken When the DTC Sets

- P0A78 is a Type A DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

P0A78 is a Type A DTC.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0A78 is not set.
    - **If the DTC is set**
    1. Clear the DTC, vehicle OFF for 2 minutes to allow all control modules to shut down.
    2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
    3. Verify the DTC does not set.
        - If the DTC sets, continue to Circuit/System Testing.
        - If the DTC does not set.
    4. All OK.
    - **If none of the DTCs are set**
3. All OK.

Circuit/System Testing

NOTE: **Perform Circuit/System Verification before Circuit/System Testing.**

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the High Voltage Disabling procedure for servicing the T6 Power Inverter Module or T12 Transmission.
2. Remove the 3-phase cable assembly from the T6 Power Inverter Module. Refer to Drive Motor Power Inverter Module 3 Phase Cable Replacement.
3. Test for infinite resistance between each of the AC circuit terminals listed below and ground for each phase of the M15 Drive Motor:
    - X3 terminal 3 phase U
    - X3 terminal 2 phase V
    - X3 terminal 1 phase W
    - **If less than infinite resistance**
    1. Disconnect the 3-phase cable assembly from the transmission. Refer to Drive Motor Power Inverter Module 3 Phase Cable Replacement.
    2. Test for infinite resistance between the AC circuit terminal and ground.
        - If less than infinite resistance, replace the 3-phase cable assembly.

        - If infinite resistance, replace the M15 Drive Motor Stator.
    - **If infinite resistance for all AC circuits**
4. Replace the T6 Power Inverter Module.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the M15 Drive Motor Stator.

    - **If the DTC does not set**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Power Inverter Module 3 Phase Cable Replacement** for Drive Motor 1 3-Phase Cable Assembly replacement or M15 Drive Motor replacement.
- Refer to **Drive Motor Stator Removal** for M15 Drive Motor Stator replacement.
- Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0A8D OR P0A8F: 14 V POWER MODULE SYSTEM VOLTAGE LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0A8D

14 V Power Module System Voltage Low Voltage

DTC P0A8F

14 V Power Module System Voltage High Voltage

Circuit/System Description

The 14 V power module, often referred to as the accessory DC power control module, converts the high voltage (360 V) direct current (DC) to low voltage (14 V) DC to charge the 12 V battery and to operate the power accessories. The ECM controls the 14 V power module by supplying a 5 V pulse width modulated (PWM) signal through a control circuit. The ECM monitors 12 V battery voltage to ensure the 14 V power module is maintaining the desired voltage.

Conditions for Running the DTC

14 V power module is commanded ON.

Conditions for Setting the DTC

The ECM monitored battery voltage is less than or equal to 11 V for 60 s within a 75 s window.

Action Taken When the DTC Sets

- The charge indicator is illuminated.
- The 14 V power module stops supplying power to the 12 V system.
- DTCs P0A8D and P0A8F are Type C DTCs.

Conditions for Clearing the DTC

DTCs P0A8D and P0A8F are Type C DTCs.

Diagnostic Aids

An improperly fastened 150-amp in-line mega-fuse may cause this DTC to set.

DTC P1E00

Hybrid/EV Powertrain Control Module 2 Requested MIL Illumination

DTC P25A2

Brake System Control Module Requested MIL Illumination

DTC P25C9

Brake System Control Module 2 Requested MIL Illumination

DTC P26C8

Chassis Control Module Requested MIL Illumination

Circuit/System Description

Control modules constantly monitor the vehicle for any condition which may adversely affect vehicle performance. If a condition is detected, the module sets a DTC and sends a serial data message to the engine control module (ECM). The ECM sets a DTC to inform the technician that the module has set a DTC. The serial data message sent by the module also contains a request for the ECM to illuminate the malfunction indicator lamp (MIL).

The technician can observe the DTC that was set by the module by reviewing the ECM Freeze Frame records on the scan tool. The ECM Freeze Frame records also contain the engine operating conditions present when the DTC set.

Conditions for Running the DTC

- The vehicle is ON for greater than 3 s.
- These DTCs run continuously.

Conditions for Setting the DTC

The ECM receives a serial data message from a specific module indicating that DTC has set in the module.

Action Taken When the DTC Sets

DTCs P0AC4, P1E00, P25A2, P25C9, or P26C8 are Type A DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0AC4, P1E00, P25A2, P25C9, or P26C8 are Type A DTCs.

Diagnostic Aids

Communication codes, U-codes, and P-codes that set in a module can request a DTC to be set in the ECM.

Circuit/System Verification

NOTE:

- **Do not replace the engine control module for these informational DTCs.**
- **Correct any engine control and communication DTCs before diagnosing these DTCs.**

1. Vehicle in Service Mode.
2. Verify there are no engine control or communication DTCs set.
   - **If a DTC is set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If a DTC is not set**
3. Verify there are no DTCs set in any other control module.
   - **If a DTC is set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If a DTC is not set**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If the DTC does not set**
6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

DTC P0AEE, P0AEF, P0AF0, P0BD2-P0BD4, OR P0BDC-P0BDE: DRIVE MOTOR INVERTER TEMPERATURE SENSOR(S)

DTC P0BDC

Drive Motor Inverter Temperature Sensor 5 Performance

DTC P0BDD

Drive Motor Inverter Temperature Sensor 5 Circuit Low Voltage

DTC P0BDE

Drive Motor Inverter Temperature Sensor 5 Circuit High Voltage

Circuit/System Description

This is an internal fault detection of the power inverter module, often called the drive motor generator power inverter module. This fault is handled inside the drive motor generator power inverter module and no external circuits are involved.

The control modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid/EV powertrain control module 1
- Drive motor control module

Conditions for Running the DTC

P0AEE, P0BD2, and P0BDC

- P0AEF, P0AF0, P0BD3, P0BD4, P0BDD, and P0BDE are not set.
- 12 hours have elapsed since the vehicle has been ON.
- Ignition ON and more than 7 hours have elapsed since battery pack conditioning or charging has taken place.

- Transmission fluid and hybrid/EV powertrain control module 1 temperature sensor average is greater than 20Ã‚Â°C (68Ã‚Â°F).

P0AEF, P0BD3, and P0BDD

The ignition is ON.

P0AF0, P0BD4, and P0BDE

- The ignition is ON.
- Ignition ON, the drive motor must operate at greater than 20 N.m (14.75 lb ft) for a cumulative time of 1.5 minutes before the DTC will run.

Conditions for Setting the DTC

P0AEE, P0BD2, and P0BDC

- A 20Ã‚Â°C (68Ã‚Â°F) difference is observed between the individual inverter phase temperature sensor and the average of all the inverter phase temperatures.
- The above condition is present for 4.75 seconds.

P0AEF, P0BD3, and P0BDD

The inverter phase temperature sensor is greater than 159Ã‚Â°C (318Ã‚Â°F) for 2.5 seconds.

P0AF0, P0BD4, and P0BDE

The inverter phase temperature sensor is less than -45Ã‚Â°C (-49Ã‚Â°F) for 3 seconds.

Action Taken When the DTC Sets

- P0AEF, P0AF0, P0BD3, P0BD4, P0BDD, and P0BDE are Type A DTCs.
- P0AEE, P0BD2, and P0BDC are Type B DTCs.
- Power to the motor will be limited.

Conditions for Clearing the DTC

- P0AEF, P0AF0, P0BD3, P0BD4, P0BDD, and P0BDE are Type A DTCs.
- P0AEE, P0BD2, and P0BDC are Type B DTCs.

Drive Motor Phase W Current Sensor Circuit High Voltage

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the drive motor generator power inverter module and no external circuits are involved.

Conditions for Running the DTC

The control module runs the program to detect an internal fault when the Hybrid wake-up circuit is active.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTCs P0BE6, P0BE7, P0BE8, P0BEA, P0BEB, P0BEC, P0BEE, P0BEF, and P0BF0 are Type A DTCs.

- Propulsion will be disabled.

Conditions for Clearing the DTC

DTCs P0BE6, P0BE7, P0BE8, P0BEA, P0BEB, P0BEC, P0BEE, P0BEF, and P0BF0 are Type A DTCs.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0BE6, P0BE7, P0BE8, P0BEA, P0BEB, P0BEC, P0BEE, P0BEF, or P0BF0 is not set.
   - **If any of the DTCs are set**
3. Verify the DTC does not set. If the DTC sets, replace the T6 Power Inverter Module.
   - **If the DTC does not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0BFD: DRIVE MOTOR PHASES U-V-W NOT PLAUSIBLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0BFD

Drive Motor Phases U-V-W Not Plausible

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the motor control module and the hybrid/EV powertrain control module 1. The motor control module operates the drive motor based upon hybrid/EV powertrain control module 1 commands. The motor control module controls the speed, direction and output torque of the drive motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each drive motor operates utilizing 3-phase alternating current (AC) electricity. Each insulated gate bipolar transistors operates a single phase of the drive motor. Each phase is individually identified as U, V and W. The motor control module monitors the current of each phase in order to detect power inverter module over current conditions.

Because all the motor generator phase circuits are electrically joined together, they should each flow about the same amount of current. The motor control modules perform a mathematical calculation to verify that the phase current sensors are accurate. If the U-V-W phase current sensors indicate about the same amount of phase current, the sum of the calculation should be near zero. If the U-V-W phase currents are not similar, this DTC will set.

Conditions for Running the DTC

- The vehicle is ON.
- The high voltage contactor relays are closed.

Conditions for Setting the DTC

The sum of the 3 phase current sensors is greater than 149 A.

Action Taken When the DTC Sets

- P0BFD is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

P0BFD is a Type A DTC.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0BFD is not set.
    - **If any of the DTCs are set**
    1. Clear the DTC, vehicle OFF for 2 minutes to allow all control modules to shut down.
    2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
    3. Verify the DTC does not set.
        - If the DTC sets, continue to Circuit/System Testing.
        - If the DTC does not set.
    4. All OK.
    - **If none of the DTCs are set**
3. All OK.

Circuit/System Testing

NOTE: **Perform Circuit/System Verification before Circuit/System Testing.**

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the **High Voltage Disabling** procedure for servicing the T6 Power Inverter Module cable connections.
2. Remove the 3-phase cable assembly from the T6 Power Inverter Module. Refer to **Drive Motor Power Inverter Module 3 Phase Cable Replacement**.
3. Test for infinite resistance between each of the AC circuit terminals listed below and ground for each phase of the M15 Drive Motor:
    - X3 terminal 3 phase U
    - X3 terminal 2 phase V
    - X3 terminal 1 phase W
    - **If less than infinite resistance**
    1. Disconnect the 3-phase cable assembly from the transmission. Refer to **Drive Motor Power Inverter Module 3 Phase Cable Replacement**.
    2. Test for infinite resistance between the AC circuit terminal and ground for each phase of the M15 Drive Motor:
        - X3 terminal 3 phase U
        - X3 terminal 2 phase V
        - X3 terminal 1 phase W
        - If less than infinite resistance, replace the 3-phase cable assembly.
        - If infinite resistance, replace the M15 Drive Motor Stator.
    - **If infinite resistance for all AC circuits**
4. Replace the T6 Power Inverter Module.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the M15 Drive Motor Stator.

    - **If the DTC does not set**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Stator Removal** for T15 Drive Motor Stator replacement.
- Refer to **Drive Motor Power Inverter Module 3 Phase Cable Replacement** for Drive Motor 3-Phase Cable Assembly replacement.
- Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

   - **If a concern is found**

     Repair or replace the restricted or damaged components as necessary.

   - **If no concern is found**
4. Inspect for proper operation of all hybrid/EV system coolant pumps. Refer **Hybrid/EV Electronics Cooling Diagnostic (Drive Motor Generator Power Inverter Module Cooling System)** **Hybrid/EV Electronics Cooling Diagnostic (Drive Motor Battery Cooling System)** for Drive Motor Generator Power Inverter Module Cooling System.
   - **If a concern is found**

     Repair or replace the coolant pumps as necessary.

   - **If no concern is found**
5. Command the cooling fans through all operating speeds.
   - **If the cooling fans do not operate in all speeds**

     Refer to **Hybrid/EV Electronics Cooling Diagnostic (Drive Motor Generator Power Inverter Module Cooling System)** **Hybrid/EV Electronics Cooling Diagnostic (Drive Motor Battery Cooling System)** for Drive Motor Generator Power Inverter Module Cooling System.

   - **If the cooling fans operate in all speeds**
6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P0C17 OR P1B0F: DRIVE MOTOR 1 POSITION NOT LEARNED/LEARN INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0C17

Drive Motor 1 Position Not Learned

DTC P1B0F

Drive Motor 1 Position Learn Incorrect

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The motor control module monitors the angular position, speed and direction of the drive motor rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 V AC, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor rotor.

A measurement called offset is needed for accurate determination of the motor position. Offset is the relationship between the position sensor and the drive motor generator output shaft. Whenever the vehicle is cycled to OFF, the motor control module attempts to learn the offset of the drive motor position sensor by rapidly oscillating the motor and observing the position sensor signals.

The motor control module will attempt to learn the position at hybrid wake-up, vehicle ON only if no valid offset value has ever been learned. The non-learned condition would normally occur only after a motor control module reprogramming event.

Conditions for Running the DTC

P0C17

- Vehicle is cycled from OFF to ON.
- The motor control module has no valid drive motor position sensor offset value in memory.

P1B0F

- Vehicle is cycled from ON to OFF.
- The motor control module has learned a valid drive motor position sensor offset value at least once.

Conditions for Setting the DTC

Condition 1

Position sensor offset value not learned because drive motor speed is greater than 150 RPM.

Condition 2

Position sensor offset value not learned because hybrid battery voltage as observed at the motor control module is less than 191 V.

Condition 3

Position sensor offset value not learned because drive motor phase to phase current difference is less than 30 A.

Action Taken When the DTC Sets

P0C17

- DTC P0C17 is a Type A DTC.
- Propulsion is disabled. The vehicle cannot operate without a previously stored offset value or the ability to learn offset.

P1B0F

- DTC P1B0F is a Type B DTC.
- The motor control module operates the drive motor generator using the last valid learned offset.

Conditions for Clearing the DTC

- DTC P0C17 is a Type A DTC.

- DTC P1B0F is a Type B DTC.

Diagnostic Aids

- If the vehicle is powered off while driving DTC P1B0F may set.
- The drive motor position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, corrosion, and terminal damage. Extreme care must be taken when probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.
- If the customer comments that the problem occurs only during moist environmental conditions: rain, snow, vehicle wash, etc., inspect the sensor wiring for signs of water intrusion.
- The sensor circuit loops are a twisted pair with each pair covered in a foil shield. The shield circuits outside of the transmission are grounded to a stud on the power inverter module, often referred to as the drive motor generator power inverter module.
- The drive motor position sensor harness circuits are shielded. Improperly grounded shield circuits may cause inaccurate sensor signals.
- Intermittent appearance of DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03 suggests intermittent position sensor circuit or connector problems.
- The drive motor control module 1 monitors and report the Drive Motor Position Sensor Offset Learn Status. This information can be observed using a scan tool. Status is updated during the transition from vehicle ON to vehicle OFF during normal conditions. Alternating, and possibly intermittent, appearance of "Not Run," "Learn Failed Motor Speed Not Zero," and "Motor Current Incorrect" suggests intermittent position sensor circuit or connector problems.
- Intermittent appearance of "Motor Current Incorrect" suggests loose 3-phase cable assembly connections at the power inverter module or drive motor.

Drive Motor Position Sensor Offset Learn Status Descriptions

Drive Motor Position Sensor Offset Learn Status	Description	May Be Caused By
Not Run	Not run yet, waiting for key off	NA
	Aborted run due to detecting high voltage too low or motor speed too high	Key off while rolling, drive motor position sensor circuit problems, or high voltage system problems
	Ran but failed due to out of range values	Resolver or drive motor problems
Learn Successful	Position offset learned and stored successfully	NA
Learn Failed Motor Speed Not Zero	Speed high during offset learn but not before	Drive motor position sensor circuit problems
Learn Failed - High Voltage Too Low	High voltage contactors opened during offset learn	High voltage system problems
Motor Current Incorrect	Low current on 3-phase circuits between power inverter module and drive motor	Drive motor, power inverter module, or 3-phase cable assembly problem

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTCs P0A3F, P0A40, P0A78, P0C01, P0C05, P0C0B, P0C4E, P0C52, P0C53, P0C5C, P0C5D, P1B03, or P1B0D is not set.
    - **If any of the DTCs are set**
    - Refer to Diagnostic Trouble Code (DTC) List - Vehicle .
    - **If none of the DTCs are set**

NOTE: **When turning vehicle OFF, open and close the driver door and wait 1 minute to**

allow all modules to shut down.

3. Cycle vehicle power 4 times, using a scan tool to monitor the state of the Drive Motor Position Sensor Offset Learn Status.
    - **If Drive Motor Position Sensor Offset Learn Status showed Motor Current Incorrect all 4 cycles**

      Refer to 3-Phase Circuit Malfunction in Circuit/System Testing.

    - **If Drive Motor Position Sensor Offset Learn Status did not show Motor Current Incorrect all 4 cycles**
4. Vehicle ON.
5. Verify DTC P0C17 or P1B0F is not set.
    - **If any of the DTCs are set**
    1. Verify the K114A Hybrid Powertrain Control Module has the latest calibration in Calibration Information.
        - If the K114A Hybrid Powertrain Control Module does not have the latest calibration, program the K114A Hybrid Powertrain Control Module.
        - If the K114A Hybrid Powertrain Control Module has the latest calibration, replace the T6 Power Inverter Module.
    2. Verify the DTC does not set.
        - If the DTC sets, replace the T6 Power Inverter Module.
        - If the DTC does not set
    3. All OK.
    - **If none of the DTCs are set**
6. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing**

3-Phase Circuit Malfunction

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Perform the **High Voltage Disabling** procedure for servicing the T6 Power Inverter Module or T12 Transmission.
2. Remove the 3-phase cable assembly from the T6 Power Inverter Module. Refer to **Drive Motor Power Inverter Module Replacement**.
3. Test for infinite resistance between each of the AC circuit terminals listed below and ground for each phase of the M15 Drive Motor:

   Drive Motor

   - X5 terminal 3 phase U
   - X5 terminal 2 phase V
   - X5 terminal 1 phase W
   - **If less than infinite resistance**
   1. Disconnect the 3-phase cable assembly from the transmission.
   2. Test for infinite resistance between the AC circuit terminal and ground and between the AC circuit terminal and the aluminum cable mounting block.
      - If less than infinite resistance, replace the 3-phase cable assembly.
      - If infinite resistance, replace the M15 Drive Motor Stator.
   - **If infinite resistance for all AC circuits**
4. Replace the T6 Power Inverter Module.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Replace the M15 Drive Motor Stator.

   - **If the DTC does not set**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Power Inverter Module 3 Phase Cable Replacement** for Drive Motor 3-Phase Cable Assembly replacement.
- Refer to **Drive Motor Stator Removal** for T15 Drive Motor Stator replacement.
- Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0C19: DRIVE MOTOR TORQUE DELIVERED PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0C19

Drive Motor Torque Delivered Performance

Circuit/System Description

The drive motor is controlled by a motor control module. The motor control module constantly monitors the requested torque and the delivered torque of the drive motor. The control modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid/EV powertrain control module 1
- Drive motor control module

Conditions for Running the DTC

- Vehicle ON.
- DTCs P1AEC, P1AE8, P1AE9, P1B41, P1AF5, P1B0C, P0BE6, P0BE7, P0BE8, P0BEA, P0BEB, P0BEC, P0BEE, P0BEF, P0BF0 are not set.
- The drive motor is commanded to develop torque greater than 148 N.m (109 lb ft).

Conditions for Setting the DTC

The motor control module has detected that drive motor torque is not being delivered as expected.

Action Taken When the DTC Sets

- P0C19 is a Type A DTC.
- The power to the motor will be limited.

Conditions for Clearing the DTC

P0C19 is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0C19 is not set.
    - **If the DTC is set**
    1. Verify the DTC does not set.
        - If the DTC sets, replace the T6 Power Inverter Module.
        - If the DTC does not set.
    2. All OK.
    - **If the DTC is not set**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the M15 Drive Motor Stator and Rotor.

    - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Stator Removal** for M15 Drive Motor Stator replacement.
- Refer to **Drive Motor Rotor Removal**
- Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0C2D OR P0C2E: ELECTRIC/AUXILIARY TRANSMISSION FLUID PUMP CONTROL MODULE FEEDBACK CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0C2D

Electric/Auxiliary Transmission Fluid Pump Control Module Feedback Circuit Low Voltage

DTC P0C2E

Electric/Auxiliary Transmission Fluid Pump Control Module Feedback Circuit High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the motor control module and the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump by providing a 12 V ground pulse width modulation (PWM) signal to the pump motor to request a specific motor speed.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

DTC P0C2D

The pulse width modulated (PWM) feedback signal measured by hybrid/EV powertrain control module 1 is less than 2% for 6 seconds.

DTC P0C2E

The pulse width modulated (PWM) feedback signal measured by hybrid/EV powertrain control module 1 is greater than 98% for 6 seconds.

Action Taken When the DTC Sets

- DTCs P0C2D and P0C2E are Type A DTCs.
- Vehicle speed will be limited, the Propulsion Power is Reduced message will be illuminated.

Conditions for Clearing the DTC

- DTCs P0C2D and P0C2E are Type A DTCs.
- The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Verify no ECM loss of communication DTCs U0100/U1818 are set indicating that a KR75 Engine Controls Ignition Relay concern is present.
    - **If any of the DTCs were set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If the DTCs were not set**
2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
3. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC is not set**
4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G5 Transmission Fluid Pump Electric/Auxiliary.
2. Test for less than 5 Ω between the ground circuit terminal 6 and ground.
    - **If 5 Ω or greater**

      Repair the open/high resistance on the ground circuit.

    - **If less than 5 Ω**
3. Vehicle ON.
4. Test for B+ between the B+ circuit terminal 1 and the ground circuit terminal 6.
    - **If less than B+**
    1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω and the fuse is blown
    3. Replace the G5 Transmission Fluid Pump Electric/Auxiliary.
    - **If B+**

NOTE: **This ignition circuit is powered by the KR75 Engine Controls Ignition Relay.**

5. Test for B+ between the ignition circuit terminal 3 and the ground circuit terminal 6.
    - **If less than B+**
    1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 3 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω and the fuse is blown

   3. Replace the G5 Transmission Fluid Pump Electric/Auxiliary.
   - **If B+**
6. Connect a test lamp between the enable circuit terminal 5 and the ground circuit terminal 6.
7. Vehicle OFF. Verify the test lamp is OFF.
   - **If the test lamp is ON**
   1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
   2. Test for less than 1 V between the pump enable circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Replace the T6 Power Inverter Module.
   - **If the test lamp is OFF**
8. Vehicle ON, verify the test lamp illuminates. Command the Auxiliary Transmission Fluid Pump ON (20 - 70%) with a scan tool if necessary.
   - **If the test lamp is OFF**
   1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
   2. Test for infinite resistance between the enable circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the enable circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω
   4. Replace the X1 harness connector at the T6 Power Inverter Module.
   - **If the test lamp is ON**
9. Connect a test lamp between the control circuit terminal 4 and the B+ circuit terminal 1.
10. Verify that a test lamp changes illumination between bright (20%) and dim (70%) when commanding the Auxiliary Transmission Fluid Pump ON between 20% and 70% with a scan tool.
    - **If the test lamp is always dim or does not illuminate**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module. Vehicle ON.
    2. Test for less than 1 V between the control circuit terminal and ground.
       - If 1 V or greater, repair the short to voltage on the circuit.
       - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω
    4. Replace the T6 Power Inverter Module.
    - **If the test lamp is always bright**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
    2. Test for infinite resistance between the control circuit and ground.
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω
    4. Replace the T6 Power Inverter Module.
    - **The test lamp changes illumination between bright (20%) and dim (70%)**
11. Remove the test lamp.
12. Verify the scan tool, Auxiliary Transmission Fluid parameter is 0%.
    - **If greater than 0%**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
    2. Test for infinite resistance between the feedback circuit terminal 5 and ground.

    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
  3. Replace the T6 Power Inverter Module.
  - **If 0%**
13. Install a 3 A fused jumper wire between the feedback circuit terminal 5 and the ground circuit terminal 6.
14. Verify the scan tool Hybrid Battery Pack Coolant Pump parameter is greater than 90%.
  - **If 90% or less**
  1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
  2. Test for less than 1 V between the feedback circuit terminal and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V
  3. Test for less than 2 Ω in the feedback circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω
  4. Replace the T6 Power Inverter Module.
  - **If greater than 90%**
15. Replace the G5 Transmission Fluid Pump Electric/Auxiliary.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Transmission Fluid Pump Removal** for G5 Auxiliary Transmission Fluid Pump Electric/Auxiliary, often referred to as the A/Trans Aux Fluid Pump Motor, replacement.
- Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, setup, and programming.

DTC P0C4E: DRIVE MOTOR POSITION EXCEEDED LEARNING LIMIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0C4E

Drive Motor Position Exceeded Learning Limit

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The motor control module monitors the angular position, speed and direction of the drive motor rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 V AC, 12 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor rotor.

A measurement called offset is needed for accurate determination of the motor position. Offset is the relationship between the position sensor and the drive motor generator output shaft. Whenever the vehicle is cycled to OFF, the motor control module attempts to learn the offset of the drive motor position sensor by rapidly oscillating the motor and observing the position sensor signals.

Conditions for Running the DTC

The vehicle is cycled OFF.

Conditions for Setting the DTC

- The position sensor total offset exceeds 15 degrees during the learning process.
- The current learned value differs from the previous learned value by greater than 10 degrees.

Action Taken When the DTC Sets

DTC P0C4E is a Type A DTC.

Conditions for Clearing the DTC

DTC P0C4E is a Type A DTC.

Diagnostic Aids

- The drive motor position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, corrosion, and terminal damage. Extreme care must be taken when probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.
- If the customer comments that the problem occurs only during moist environmental conditions: rain, snow, vehicle wash, etc., inspect the sensor wiring for signs of water intrusion.
- The sensor circuit loops are a twisted pair with each pair covered in a foil shield. The shield circuits outside of the transmission are grounded to a stud on the power inverter module, often referred to as the drive motor generator power inverter module.
- The drive motor position sensor harness circuits are shielded. Improperly grounded shield circuits may cause inaccurate sensor signals.
- Intermittent appearance of DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03 suggests intermittent position sensor circuit or connector problems.
- Drive motor control module monitors and reports the Drive Motor Position Sensor Offset Learn Status. This information can be observed using a scan tool. Status is updated during the transition from vehicle ON to vehicle OFF during normal conditions. Alternating, and possibly intermittent, appearance of "Not Run," "Learn Failed Motor Speed Not Zero," and "Motor Current Incorrect" suggests intermittent position sensor circuit or connector problems.

Drive Motor Position Sensor Offset Learn Status Descriptions

Drive Motor Position Sensor Offset Learn Status	Description	May Be Caused By
Not Run	Not run yet, waiting for key off	NA
	Aborted run due to detecting high voltage too low or motor speed too high	Key off while rolling, drive motor position sensor circuit problems, or high voltage system problems
	Ran but failed due to out of range values	Resolver or drive motor problems
Learn Successful	Position offset learned and stored successfully	NA
Learn Failed Motor Speed Not Zero	Speed high during offset learn but not before	Drive motor position sensor circuit problems
Learn Failed - High Voltage Too Low	High voltage contactors opened during offset learn	High voltage system problems
Motor Current Incorrect	Low current on 3-phase circuits between power inverter module and drive motor	Drive motor, power inverter module, or 3-phase cable assembly problem

3. Verify DTC P0C4E is not set.
    - **If the DTC sets**
    1. Perform each of the operations listed below one at a time until the fault is corrected.
        1. Replace the B228 Drive Motor Position Sensor
        2. Replace the T6 Power Inverter Module
    2. Repeat the DTC check in step 3.
    - **If the DTC does not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Position Sensor Stator Removal** for B228 Drive Motor Position Sensor replacement.
- Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P0C76: HYBRID/EV BATTERY SYSTEM HIGH VOLTAGE PRESENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0C76

Hybrid/EV Battery System High Voltage Present

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors system high voltage via the battery energy control module. The battery energy control module will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery energy control module to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for diagnostic trouble code (DTC) information.

The hybrid/EV battery pack contains 4 high voltage contactors. The high voltage contactors allow the high voltage DC to be connected to the vehicle or safely contained within the hybrid/EV battery pack. For more information on the high voltage contactors, refer to **Drive Motor Battery System Description** .

Conditions for Running the DTC

Vehicle is ON.

Conditions for Setting the DTC

The high voltage bus voltage is greater than 60 V 3.5 seconds after the contactors have been commanded open.

Action Taken When the DTC Sets

- DTC P0C76 is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

- DTC P0C76 is a Type A DTC.
- The **Clear Secured High Voltage DTCs** reset function must be performed to prevent resetting the DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Verify the contactors are operating normally. Refer to **Hybrid/EV Battery Voltage Present** .
   - **If the contactors are not operating properly**

     Repair as necessary.

   - **If the contactors are operating properly**
2. Vehicle ON.
3. With a scan tool, perform the **Clear Secured High Voltage DTCs** reset function.
4. Verify DTC P0C76 is not set.
   - **If the DTC is set**

     Replace the T6 Power Inverter Module.

   - **If the DTC is not set**
5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P150D OR P150E: SUPPLY VOLTAGE CIRCUIT 2/1 LOW VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P150D

Supply Voltage Circuit 2 Low Voltage

DTC P150E

Supply Voltage Circuit 1 Low Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the motor control module and the hybrid/EV powertrain control module 1. The motor control module operates the drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground. The motor control modules and the hybrid/EV powertrain control module 1 are part of the power inverter module and are not serviced separately.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

P150D

Battery voltage on circuit 2 is less than 8.0 V for more than 2.0 seconds.

P150E

Battery voltage on circuit 1 is less than 8.0 V for more than 2.0 seconds.

Action Taken When the DTC Sets

- DTC P150D and P150E are Type C DTCs.
- Propulsion will be disabled.

Conditions for Clearing the DTC

DTC P150D and P150E are Type C DTCs.

Circuit/System Testing

1. Vehicle ON.
2. Verify DTC P0562 or P0563 is not set.
    - **If any of the DTCs are set**

Refer to **DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C, P1A0D, or P1EFC** .

- **If none of the DTCs are set**

3. Verify DTC P150D or P150E is not set.
    - **If DTC P150D is set**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
    2. Verify a test lamp illuminates between the B+ circuit terminal M4 and ground.
        - If the test lamp does not illuminate and the circuit fuse is good
        1. Remove the test lamp.
        2. Test for less than 2 Ω in the B+ circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
        - If the test lamp does not illuminate and the circuit fuse is open
        1. Remove the test lamp.
        2. Test for infinite resistance between the B+ circuit and ground.
            - If less than infinite resistance, repair the short to ground on the circuit.
            - If infinite resistance, replace the T6 Power Inverter Module.
        - If the test lamp illuminates
    3. Verify the K114A Hybrid Powertrain Control Module has the latest calibration in Calibration Information.
        - If the K114A Hybrid Powertrain Control Module does not have the latest calibration, program the K114A Hybrid Powertrain Control Module.
        - If the K114A Hybrid Powertrain Control Module has the latest calibration, replace the T6 Power Inverter Module.
    4. Verify the DTC does not set.
        - If the DTC sets, replace the T6 Power Inverter Module.
        - If the DTC does not set
    5. All OK.
    - **If DTC P150E is set**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
    2. Verify a test lamp illuminates between the B+ circuit terminal M1 and ground.
        - If the test lamp does not illuminate and the circuit fuse is good
        1. Remove the test lamp.
        2. Test for less than 2 Ω in the B+ circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
        - If the test lamp does not illuminate and the circuit fuse is open
        1. Remove the test lamp.
        2. Test for infinite resistance between the B+ circuit and ground.
            - If less than infinite resistance, repair the short to ground on the circuit.
            - If infinite resistance, replace the T6 Power Inverter Module.
        - If the test lamp illuminates
    3. Verify the K114A Hybrid Powertrain Control Module has the latest calibration in Calibration Information.
        - If the K114A Hybrid Powertrain Control Module does not have the latest calibration, program the K114A Hybrid Powertrain Control Module.
        - If the K114A Hybrid Powertrain Control Module has the latest calibration, replace the T6 Power Inverter Module.
    4. Verify the DTC does not set.
        - If the DTC sets, replace the T6 Power Inverter Module.
        - If the DTC does not set

    5. All OK.
        - **If none of the DTCs are set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P15F1: AXLE TORQUE REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P15F1

Axle Torque Request Signal Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor monitors the data to verify that the indicated axle torque requested calculation is correct.

Conditions for Running the DTC

- Vehicle is ON for more than 0.5 s.
- The system voltage is above 9.5 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F1 is a Type A DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

DTC P15F1 is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P15F1 is not set.
    - **If the DTC is set**

      Replace the K20 ECM.

- **If the DTC is not set**

3. Verify the DTC does not set.
    - **If the DTC is set**

      Replace the T6 Power Inverter Module.

    - **If the DTC is not set**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P15FC: HYBRID/EV BATTERY CONTACTOR STATUS MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P15FC

Hybrid/EV Battery Contactor Status Message Counter Incorrect

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the drive motor generator power inverter module and no external circuits are involved.

Conditions for Running the DTC

The control module runs the program to detect an internal fault when the Hybrid wake-up circuit is active.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15FC is a Type A DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

DTC P15FC is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify no 12V battery system voltage LOW DTCs are set or that a low 12V battery condition was not present at the time P15FC was set.
    - **If any of the DTCs were set or a low 12V battery condition was present**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If the DTCs were not set or a low 12V battery condition was not present**

3. Verify DTC P15FC is not set.
    - **If the DTC is set**

      Replace the T6 Power Inverter Module.

    - **If the DTC is not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup.

DTC P16F3: CONTROL MODULE REDUNDANT MEMORY PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P16F3

Control Module Redundant Memory Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 monitors its ability to read and write to the memory. The hybrid/EV powertrain control module 1 processor stores identical data in two locations and compares the data to verify that the stored data is correct.

Conditions for Running the DTC

The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The control module has detected that when some critical data is stored it is not the same as when it is retrieved.

Action Taken When the DTC Sets

- P16F3 is a Type A DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

P16F3 is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.

2. Verify any communication U-code DTC is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Verify DTC P16F3 is not set.
    - **If the DTC is set**
4. Verify the DTC does not set. If the DTC sets, replace the T6 Power Inverter Module.
    - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P16F4: CONTROL MODULE TRANSMISSION RANGE SWITCH INPUT CIRCUITRY PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P16F4

Control Module Transmission Range Switch Input Circuitry Performance

Circuit/System Description

The transmission internal mode switch, often referred to as the automatic transmission manual shift shaft position switch, is a hall-effect switch attached to the transmission case within the transmission. The 5 outputs from the switch indicate which position is selected by the transmission manual shaft. Five outputs (A, B, C, P, S) are range selection inputs to the hybrid/EV powertrain control module 1. The input voltage at the modules is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as Internal Mode Switch A/B/C/P/S. The Internal Mode Switch Range input parameters represented are transmission range signal A, signal B, signal C, and signal P signal S. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

- The vehicle is ON.
- Ignition voltage is greater than 9.5 V.

Conditions for Setting the DTC

The control module has detected the commanded transmission range state is not correct based upon internal calculations or by a comparison to input or output torque conditions.

Action Taken When the DTC Sets

- P16F4 is a Type A DTC.
- Vehicle propulsion will be disabled.

Conditions for Clearing the DTC

P16F4 is a Type A DTC.

    - **If none of the DTCs are set**
2. Verify that DTC P16F4 is not set.
    - **If the DTC is set**
    1. Verify the K114A Hybrid Powertrain Control Module has the latest calibration in Calibration Information.
        - If the K114A Hybrid Powertrain Control Module does not have the latest calibration, program the K114A Hybrid Powertrain Control Module.
        - If the K114A Hybrid Powertrain Control Module has the latest calibration, replace the T6 Power Inverter Module.
    2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
    3. Verify the DTC does not set.
        - If the DTC sets, replace the T6 Power Inverter Module.
        - If the DTC does not set
    4. All OK
    - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup.

DTC P16FF: ENGINE CONTROLS IGNITION RELAY REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P16FF

Engine Controls Ignition Relay Request Signal Message Counter Incorrect

Circuit/System Description

The Chassis Control Module sends a powertrain relay request to the ECM over serial data. The ECM sets this DTC when it detects a discrepancy in the structure of this message, causing the message integrity to be questioned.

Conditions for Running the DTC

- The propulsion system is active.
- Arbitrated battery voltage is greater than 11 V.
- Serial data communication is greater than 3 s.

Conditions for Setting the DTC

- The ECM has detected 8 engine controls ignition relay signal rolling count errors out of 10 samples.

  OR

- Continuous engine controls ignition relay signal rolling count errors for 2 s out of a 2.5 s window.

Action Taken When the DTC Sets

DTC P16FF is a Type A DTC.

Conditions for Clearing the DTC

DTC P16FF is a Type A DTC.

Diagnostic Aids

When attempting to set ECM serial data DTCs, run the vehicle in propulsion system active mode for at least 1 minute, and then shut the vehicle off for 30 seconds. Following this procedure will allow for a complete ECM shutdown.

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for ECM replacement, programming and setup.

DTC P190A-P190C: DRIVE MOTOR 1 INVERTER PHASE U/V/W TEMPERATURE ERRATIC

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P190A

Drive Motor 1 Inverter Phase U Temperature Erratic

DTC P190B

Drive Motor 1 Inverter Phase V Temperature Erratic

DTC P190C

Drive Motor 1 Inverter Phase W Temperature Erratic

Circuit/System Description

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The inverter phase temperature is intermittent.

Actions Taken When the DTC Sets

- DTCs P190A-P190C are Type A DTCs.
- Propulsion will be reduced.

Conditions for Clearing the DTC

DTCs P190A-P190C are Type A DTCs.

Reference Information

DTC P1AE8 OR P1AE9: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY VOLTAGE SENSE CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1AE8

Drive Motor Control Module Hybrid/EV Battery Voltage Sense Circuit Low Voltage

DTC P1AE9

Drive Motor Control Module Hybrid/EV Battery Voltage Sense Circuit High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the drive motor control module. The drive motor control module monitors its internal high voltage sensor for correct operation, no external circuits are involved. The modules listed below are part of the power inverter module and are not serviced separately.

- Hybrid/EV powertrain control module 1
- Motor control module

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is greater than 9.5 V.
- The high voltage contactor relays are closed.

Conditions for Setting the DTC

P1AE8

With the hybrid/EV battery system contactors closed, the drive motor control module detects high voltage sensor voltage less than 30 V.

P1AE9

The drive motor control module detects high voltage sensor voltage greater than 600 V.

Action Taken When the DTC Sets

- P1AE8 and P1AE9 are Type A DTCs.
- Propulsion will be disabled.

Conditions for Clearing the DTC

P1AE8 and P1AE9 are Type A DTCs.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P1AEE is not set.
    - **If the DTC is set**

      Refer to **DTC P1AEC or P1AEE**.

    - **If the DTC is not set**
3. Verify DTC P1AE8 and P1AE9 is not set.
    - **If any of the DTCs are set**
4. Verify the DTC does not set. If the DTC sets, replace the T6 Power Inverter Module.
    - **If none of the DTCs are set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup.

DTC P1AEC OR P1AEE: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1AEC

Drive Motor Control Module Hybrid/EV Battery System Voltage

DTC P1AEE

Drive Motor Control Module Hybrid/EV Battery System Voltage High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module contains the drive motor control module. The motor control module measures hybrid battery high voltage with several internal sensors. The hybrid/EV powertrain control module 2 also monitors high voltage with several internal sensors. The hybrid/EV powertrain control module 2 high voltage measurement is broadcast over serial data. The control modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid/EV powertrain control module 1
- Drive motor control module

P1AEC

The motor control module compares the motor control module voltage value with the hybrid/EV powertrain control 2 battery pack voltage value to insure accuracy.

P1AEE

The motor control module monitors for high voltage that is greater than the system expects during normal operation.

Conditions for Running the DTC

The hybrid/EV battery system contactor relays are closed.

P1AEC

P1AE8 or P1AE9 are not set.

Conditions for Setting the DTC

P1AEC

A difference of more than 40 V on the high voltage circuit is detected between the hybrid/EV powertrain control module 1 and the hybrid/EV powertrain control module 2 high voltage sensor.

Or

A difference of more than 50 V on the high voltage circuit is detected between the motor control module and the sum of the isolation voltage sensor values.

P1AEE

Greater than 443 V on the high voltage circuit is detected by the motor control module.

Action Taken When the DTC Sets

P1AEC

- P1AEC is a Type A DTC.
- The power to the motor will be limited.

P1AEE

- P1AEE is a Type A DTC.
- Propulsion will be disabled

Conditions for Clearing the DTC

- P1AEC is a Type A DTC.
- P1AEE is a Type A DTC.

Diagnostic Aids

Conditions such as loss of battery energy control module power or ground or removal of the high voltage manual disconnect while the vehicle was driving could create a voltage surge that may set DTC P1AEE. History DTC P1AEE may indicate that the high voltage contactor relays opened while large current flow was present.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0ABB, P0ABC, or P0ABD is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Verify DTC P1AEC or P1AEE is not set.
    - If the DTC sets, replace the T6 Power Inverter Module.
    - If the DTC does not set.
4. All OK.
    - **If none of the DTCs are set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P1AF0: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY VOLTAGE SYSTEM ISOLATION LOST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1AF0

Drive Motor Control Module Hybrid/EV Battery Voltage System Isolation Lost

Circuit/System Description

Vehicles equipped with high voltage storage and propulsion capability are designed with the high voltage circuits isolated from the vehicle chassis.

The power inverter module, often referred to as the drive motor generator power inverter module, contains the drive motor control module and the hybrid/EV powertrain control module 1. The motor control module monitors high voltage with several internal sensors. The motor control module tests for loss of isolation between each high voltage bus and vehicle chassis when the high voltage contactors are closed. The hybrid/EV powertrain control module 2 also tests the hybrid/EV battery pack for high voltage loss of isolation but when the high voltage contactors are open.

If the motor control module detects an isolation fault on either the positive or negative high voltage bus, the hybrid/EV powertrain control module 1 reports a fault. The isolation fault may be caused by any component in the high voltage system.

Conditions for Running the DTC

- P1AE8, P1AE9, P1AEC, P1AF5, P1B0C, or P1B41 is not set.
- The high voltage contactor relays are closed.
- High voltage is greater than 50 V.
- Ignition is ON.
- The vehicle is not being charged or the drive motor is commanded to develop torque.

Conditions for Setting the DTC

The ratio between negative Mid-Pack Voltage and positive Mid-Pack Voltage is greater than 4.53 V or less than 0.21 V for greater than 2.5 seconds.

Action Taken When the DTC Sets

P1AF0 is a Type B DTC.

Conditions for Clearing the DTC

P1AF0 is a Type B DTC.

      Refer to **Loss of Isolation on the High Voltage Main Bus** .

    - **If the DTCs is not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P1AF4 OR P1AF5: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY VOLTAGE ISOLATION SENSING CIRCUIT 1 LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1AF4

Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 Low Voltage

DTC P1AF5

Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 High Voltage

Circuit/System Description

Vehicles equipped with high voltage storage and propulsion capability are designed with the high voltage circuits isolated from the vehicle chassis.

The power inverter module, often referred to as the drive motor generator power inverter module, contains the drive motor control module. The motor control module measures hybrid battery high voltage with several internal sensors. The motor control module tests for loss of isolation between each high voltage bus and vehicle chassis. The motor control module tests for isolation when the high voltage contactor relays are closed. The hybrid/EV powertrain control module 2 also tests the hybrid/EV battery pack for high voltage loss of isolation, but only when the high voltage contactor relays are open.

Conditions for Running the DTC

P1AF4 and P1AF5

- The vehicle is ON.
- The hybrid/EV contactors are closed.
- The vehicle is not being charged or the drive motor is commanded to develop torque.

Conditions for Setting the DTC

P1AF4

The motor control module detects isolation sensor voltage less than 15 V.

P1AF5

The motor control module detects the value of the mid-pack voltage subtracted from the pack voltage is greater than 30 V.

Action Taken When the DTC Sets

DTCs P1AF4 and P1AF5 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1AF4 and P1AF5 are Type B DTCs.

Reference Information

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0AA6 is not set.
    - **If the DTC is set**

      Refer to **DTC P0AA6 or P1AE6** .

    - **If the DTC is not set**
3. Verify DTC P1AF4 or P1AF5 is not set.
    - **If any of the DTCs are set**

      Refer to **Loss of Isolation on the High Voltage Main Bus** .

    - **If the DTC is not set**
4. Verify no other DTCs are set.
    - **If any DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no other DTCs are set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P1B0B OR P1B0C: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY VOLTAGE ISOLATION SENSING CIRCUIT 2 LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1B0B

Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 Low Voltage

DTC P1B0C

Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the drive motor control module. The motor control module measures hybrid battery high voltage with several internal sensors. The motor control module tests for loss of isolation between each high voltage bus and vehicle chassis. The motor control module tests for isolation when the high voltage contactor relays are closed. The hybrid/EV powertrain control module 2 also tests the hybrid/EV battery pack for high voltage loss of isolation, but only when the high voltage contactor relays are open.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

P1B0B

The motor control module detects isolation sensor voltage less than 15 V.

P1B0C

The motor control module detects isolation sensor voltage greater than 30 V.

Action Taken When the DTC Sets

DTCs P1B0B and P1B0C are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1B0B and P1B0C are Type B DTCs.

DTC P1B0D: DRIVE MOTOR 1 CONTROL MODULE DRIVE MOTOR 1 OVERSPEED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1B0D

Drive Motor 1 Control Module Drive Motor 1 Overspeed

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The drive motor control module monitors the angular position, speed and direction of the drive motor based upon the signals of the resolver-type position sensor. The position sensor allows the drive motor control module to determine the exact position, speed and direction of the drive motor. The control modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid/EV powertrain control module 1
- Drive motor control module

Conditions for Running the DTC

Vehicle is ON.

Conditions for Setting the DTC

Drive motor 1 speed is greater than 9,250 RPM.

Action Taken When the DTC Sets

- DTC P1B0D is a Type A DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

DTC P1B0D is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify no other Hybrid Transmission DTCs are set.
    - **If other Hybrid Transmission DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no other Hybrid Transmission DTCs are set**
3. Verify DTC P1B0D is not set.
    - **If any of the DTCs are set**

1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
2. Verify the DTC does not set.
    - If the DTC sets, replace the T6 Power Inverter Module.
    - If the DTC does not set.
3. All OK

- **If none of the DTCs are set**

4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup

DTC P1B41: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY VOLTAGE ISOLATION SENSING PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1B41

Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Performance

Circuit/System Description

Vehicles equipped with high voltage storage and propulsion capability are designed with the high voltage circuits isolated from the vehicle chassis.

The power inverter module, often referred to as the drive motor generator power inverter module, contains the drive motor control module. The motor control module measures hybrid battery high voltage with several internal sensors. The motor control module tests for loss of isolation between each high voltage bus and vehicle chassis. The motor control module tests for isolation when the high voltage contactor relays are closed. The hybrid/EV powertrain control module 2 only tests the hybrid/EV battery pack for high voltage loss of isolation when the high voltage contactor relays are open.

Conditions for Running the DTC

- DTC P1AE8, P1AE9, P1B0B, P1B0C, P1AEC, P1AF5, or P1AF4 is not set.
- The vehicle is ON.
- The hybrid/EV contactors are closed.
- The vehicle is not being charged or the drive motor is commanded to develop torque.

Conditions for Setting the DTC

The difference between the voltage sensed and hybrid battery voltage is greater than 50 V.

Action Taken When the DTC Sets

DTC P1B41 is a Type B DTC.

Conditions for Clearing the DTC

DTC P1B41 is a Type B DTC.

    - **If the DTC does not set**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

DTC P1E0A: DRIVE MOTOR CONTROL MODULE TORQUE CALCULATION PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1E0A

Drive Motor Control Module Torque Calculation Performance

Circuit/System Description

The motor control module performs redundant calculations of desired and achieved torque values. These values are continuously compared and should always be the same. The control modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid/EV powertrain control module 1
- Drive motor control module

Conditions for Running the DTC

The vehicle is in RUN.

Conditions for Setting the DTC

The redundant torque calculation does not match the primary calculation.

Action Taken When the DTC Sets

- P1E0A is a Type A DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

P1E0A is a Type A DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify no transmission or motor control module DTCs are set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Verify DTC P1E0A is not set.
   - **If any of the DTCs are set**
   1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
   2. Verify the DTC does not set.
      - If the DTC sets, replace the T6 Power Inverter Module.
      - If the DTC does not set.
   3. All OK.
   - **If none of the DTCs are set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P1E4A: CONTROL MODULE REDUNDANT DRIVE MOTOR 1 SPEED SENSING CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1E4A

Control Module Redundant Drive Motor 1 Speed Sensing Circuit

Circuit/System Description

The drive motor position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor based upon the signals of the resolver-type position sensor. The position sensor allows the motor control module to determine the exact position, speed and direction of the drive motor. The hybrid/EV powertrain control module 1 also calculates motor speed and compares it to the motor control module's value to insure the accuracy of the hybrid/EV powertrain control module's value. This fault is handled inside the power inverter module, often referred to as the drive motor generator power inverter module, and no external circuits are involved. The control modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid/EV powertrain control module 1
- Drive motor control module

Conditions for Running the DTC

- The vehicle must be ON.
- The system voltage is greater than 9.5 V.
- DTC P1E0A is not set.

Conditions for Setting the DTC

The calculated motor speed is greater than 600 RPM different from the measured speed.

Action Taken When the DTC Sets

- DTC P1E4A is a Type B DTC.
- Propulsion will be disabled.

Conditions for Clearing the DTC

DTC P1E4A is a Type B DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0562, P0563, or P0606 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Verify DTC P1E4A is not set.
    - If the DTC sets, replace the T6 Power Inverter Module.
    - If the DTC does not set.
4. All OK.
    - **If none of the DTCs are set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P1F59, P1F5A, OR P1F5B: 14 VOLT POWER MODULE STATUS TERMINAL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1F59

14 Volt Power Module Status Terminal Circuit Performance

DTC P1F5A

14 Volt Power Module Status Terminal Circuit Low Voltage

DTC P1F5B

14 Volt Power Module Status Terminal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - L Terminal	P1F5D	-	P1F5E	-
Status - F Terminal	P1F59, P1F5A	P1F59, P1F5A	P1F59, P1F5B	P1F59

Circuit/System Description

The ECM uses two circuits to control and monitor the state of the 14V power module, often referred to as the accessory DC power control module.

The control circuit functions much like the L Terminal circuit on a generator equipped vehicle. A high side driver in the ECM applies a duty cycled 5V signal to the 14V Power Module. The duty cycles controls the 14V power module output.

The status circuit functions much like the F Terminal circuit on a generator equipped vehicle. A high side driver in the 14V power module applies a duty cycled voltage to the ECM. The duty cycle indicates 14V power module internal temperature and operational condition. The ECM will detect faults on the 14V power module status circuit when the vehicle is ON.

The 14V Power Module high voltage circuit is fuse protected within the A28 hybrid/EV battery contactor assembly. The fuse protects both the T18 battery charger and the K1 14V power module. The fuse is not serviceable.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

- P1F5A: The ECM detects a 5% or lower PWM signal on the 14V power module status circuit for 8 seconds out of a 10 second window.
- P1F5B: The ECM detects a 96% or higher PWM signal on the 14V power module status circuit for 8 seconds out of a 10 second window.
- P1F59: The status circuit PWM signal is not in a valid range.

Action Taken When the DTC Sets

DTCs P1F59, P1F5A and P1F5B are type C DTCs.

Conditions for Clearing the DTC

DTCs P1F59, P1F5A and P1F5B are type C DTCs.

Circuit/System Verification

1. Vehicle OFF. Connect the vehicle to an AC supply to begin charging.
2. Vehicle in Service Mode.
3. Verify that DTC P0D26 is not set and that the vehicle will charge.
    - **If the DTC is set or the vehicle will not charge**

      Refer to DTC P0D26 .

    - **If the DTC is not set**

NOTE: **Do not have a 12V battery charger connected during the testing.**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
6. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

DTC P1F5A or P1F5B Diagnosis

NOTE: **You must perform Circuit/System Verification first.**

1. Verify a test lamp illuminates between the 14V Power Module B+ circuit ring terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Remove the test lamp and disconnect the B+ cable at the 14V power module.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the mega fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**

   1. Remove the test lamp and disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection**
   2. Disconnect the 14V power module B+ cable.
   3. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance replace the K1 14V Power Module and the mega fuse.
   - **If the test lamp illuminates**
2. Disconnect the X2 harness connector at the 14V power module, vehicle ON.
3. Test for 3.0 - 5.5 V between the control circuit terminal X2-01 and ground.
   - **If less than 3.0 V**
   1. Vehicle OFF, disconnect the harness connectors at the K20 ECM.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If greater the 2 Ω, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 ECM.
   - **If greater than 5.5 V**
   1. Vehicle OFF, disconnect the harness connectors at the K20 ECM, Vehicle ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If greater than 1 V, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 ECM.
   - **If between 3.0 - 5.5 V**
4. Vehicle OFF, disconnect the harness connectors at the K20 ECM.
5. Test for infinite resistance between the 14V power module status circuit terminal X2-03 and ground.
   - **If less than infinite resistance**

     Repair the short to ground on the circuit.

   - **If infinite resistance**
6. Test for less than 2 Ω in the status circuit end to end.
   - **If greater the 2 Ω**

     Repair the open/high resistance in the circuit.

   - **If less than 2 Ω**
7. Disable the high voltage for servicing at the K1 14V Power Module. Refer to **High Voltage Disabling** .
8. Replace the K1 14V Power Module.
9. Enable high voltage. Refer to **High Voltage Enabling** .
10. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the K20 ECM.

    - **If the DTC does not set**
11. All OK.

DTC P1F59 Diagnosis

NOTE: **You must perform Circuit/System Verification first.**

1. Disable the high voltage system for servicing the T18 Battery Charger, K1 14V Power Module and the T24 Battery Charger-DC. Refer to **High Voltage Disabling** .
2. Disconnect the X3 connector at the T18 Battery Charger, the X1 connector at the K1 14V Power Module and the X6 connector at the T24 Battery Charger-DC.

3. Verify that all HV harness connector and the mating module connector terminals are free from moisture, corrosion, and arc flash damage.
   - **If any terminals show signs of damage**

     Replace the HV wiring harness and affected modules as necessary.

   - **If no arc flash damage, moisture, or corrosion is found**
4. Test the following HV harness terminals for less than 2 Ω end to end:
   - X6-A to X1-A
   - X6-A to X3-A
   - X6-B to X1-B
   - X6-B to X3-B
   - **If greater than 2 Ω**

     Replace the HV wiring harness.

   - **If less than 2 Ω**
5. Replace the K1 14V Power Module.
6. Enable high voltage. Refer to **High Voltage Enabling** .
7. Verify the DTC does not set.
   - **If the DTC sets**

     Replace the K20 ECM.

   - **If the DTC does not set**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Battery to Battery Positive Cable Replacement** for K1 14V Power Module/T18 Battery Charger combination cable - includes G1 A/C compressor cable.
- Refer to **Control Module References** for ECM or for K1 14V Power Module - often referred to as the Accessory DC Power Control Module replacement, programming, and setup.

DTC P1F5D OR P1F5E: 14 VOLT POWER MODULE L-TERMINAL CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1F5D

14 Volt Power Module L-Terminal Circuit Low Voltage

DTC P1F5E

14 Volt Power Module L-Terminal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - L Terminal	P1F5D	-	P1F5E	-
Status - F Terminal	P1F59, P1F5A	P1F59, P1F5A	P1F59, P1F5B	P1F59

Circuit/System Description

The ECM uses two circuits to control and monitor the state of the 14V power module, often referred to as the accessory DC power control module. The control circuit functions much like the L Terminal circuit on a generator equipped vehicle. A high side driver in the ECM applies a duty cycled voltage to the 14V power module. The duty cycle controls the 14V power module output. The ECM monitors the state of the 14V power module control circuit. The ECM will detect faults on the 14V power module control circuit when the vehicle is ON.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

- P1F5D: The ECM detects a low voltage on the 14V power module control circuit for 8 seconds out of a 10 second window.
- P1F5E: The ECM detects a high voltage on the 14V power module control circuit for 8 seconds out of a 10 second window.

Action Taken When the DTC Sets

DTCs P1F5D and P1F5E are type C DTCs.

Conditions for Clearing the DTC

DTCs P1F5D and P1F5E are type C DTCs.

Circuit/System Verification

NOTE: **Do not have a 12V battery charger connected during the testing.**

1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
2. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

  - **If the DTC does not set**

3. All OK.

Circuit/System Testing

1. Verify a test lamp illuminates between the 12V B+ circuit ring terminal X3-A at the 14V power module and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Remove the test lamp and disconnect the B+ cable at the 14V power module.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Remove the test lamp, disconnect the battery negative cable, and disconnect the 14V power module B+ cable.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
2. Disconnect the X2 harness connector at the 14V power module, vehicle ON.
3. Test for 3.0 - 5.5 V between the control circuit terminal X2-01 and ground.
   - **If less than 3.0 V**
   1. Vehicle OFF, disconnect the harness connectors at the K20 ECM.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If greater the 2 Ω, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 ECM.
   - **If greater than 5.5 V**
   1. Vehicle OFF, disconnect the harness connectors at the K20 ECM, Vehicle ON.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If greater than 1 V, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 ECM.
   - **If between 3.0 - 5.5 V**
4. Test or replace the K1 14V Power Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for ECM replacement, programming, and setup or for K1 14V Power Module, often referred to as the Accessory DC Power Control Module, replacement, programming, and setup.

DTC P2122, P2123, P2127, P2128, OR P2138: ACCELERATOR PEDAL POSITION (APP) SENSOR 1-2

Accelerator Pedal Position (APP) Sensor 1 Low Reference	-	P2123, P2138	-	P2138
Accelerator Pedal Position (APP) Sensor 2 Low Reference	-	P2128, P2138	-	P2138

Typical Scan Tool Data

APP Sensor 1

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Vehicle is On, and accelerator pedal not depressed. **Parameter Normal Range:** APP Sensor 1 0.88 - 1.08V			
Accelerator Pedal Position Sensor 1 5V Reference	0.00V	0.00V	5 - 12V
Accelerator Pedal Position Sensor 1 Signal	0.00V	0.00V	5 - 12V
Accelerator Pedal Position Sensor 1 Low Reference	-	4 - 5V	-

APP Sensor 2

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Vehicle is On, and accelerator pedal not depressed. **Parameter Normal Range:** APP Sensor 2 0.39 - 0.59V			
Accelerator Pedal Position Sensor 2 5V Reference	0.00V	0.00V	1 - 3V
Accelerator Pedal Position Sensor 2 Signal	0.00V	0.00V	2 - 5V
Accelerator Pedal Position Sensor 2 Low Reference	-	4 - 5V	-

Circuit/System Description

The accelerator pedal assembly contains 2 accelerator pedal position (APP) sensors. The APP sensors are mounted to the accelerator pedal assembly and are not serviceable. The APP sensors provide a signal voltage that changes relative to pedal position. The ECM supplies each APP sensor with a 5V reference circuit, a low reference circuit, and a signal circuit. Both the APP sensors 1 and 2 signal percentages increase as the pedal is depressed, from approximately 0% at rest to above 95% when fully depressed.

The ECM provides the accelerator pedal position or driver torque request to the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 determines how the torque output will be distributed.

Conditions for Running the DTC

P2122, P2123, P2127, P2128

- DTC P0697 is not set - P2127 or P2128.
- DTC P06A3 is not set - P2122 or P2123.
- The vehicle is ON.
- The run voltage is greater than 6.4V.
- The DTCs run continuously when the above conditions are met.

P2138

- DTCs P06A3, P0697, P2122, P2123, P2127, or P2128 are not set.
- The vehicle is ON.
- The run voltage is greater than 6.4V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P2122

The ECM detects that the APP sensor 1 voltage is less than 0.46V for greater than 1 s.

P2123

The ECM detects that the APP sensor 1 voltage is greater than 4.7V for greater than 1 s.

P2127

The ECM detects that the APP sensor 2 voltage is less than 0.32V for greater than 1 s.

P2128

The ECM detects that APP sensor 2 voltage is greater than 2.6V for greater than 0.5 s.

P2138

The voltage difference between APP sensor 1 and APP sensor 2 exceeds a predetermined value for greater than 1 s.

Action Taken When the DTC Sets

- DTCs P2122, P2123, P2127, and P2128, and P2138 are Type A DTCs.
- ECM commands the reduced power mode.
- Creep torque and hill hold are disabled.
- Service Parking Brake light is illuminated.

Conditions for Clearing the DTC

DTCs P2122, P2123, P2127, and P2128, and P2138 are Type A DTCs.

Diagnostic Aids

- A high resistance condition on the accelerator pedal sensor circuits could cause a DTC to set.
- Ensure that the in-line harness connector seals are installed correctly. Improper installation could result in water intrusion into the connector and cause a DTC to set.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P0641, P0697, or P06A3 is not set.
    - **If any of the DTCs are set**

      Refer to **DTC P0641, P0651, P0697, or P06A3** for further diagnosis.

    - **If none of the DTCs are set**
3. Verify the APP Sensor 1 Circuit Status and APP Sensor 2 Circuit Status parameter displays OK.
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing.

    - **If OK is displayed**
4. Verify the scan tool APP Sensor 1 and 2 percent parameters are equal while performing the tests listed below:
    1. Rapidly depress the accelerator pedal from the rest position to the wide open throttle position (WOT) and release pedal. Repeat the procedure several times.
    2. Slowly depress the accelerator pedal to WOT and then slowly return the pedal to closed throttle. Repeat the procedure several times.
    - **If not equal**

      Refer to Circuit/System Testing.

    - **If equal**
5. Verify that DTC P2122, P2123, P2127, P2128, or P2138 is not set.
    - **If any of the DTCs are set**

      Refer to Circuit/System Testing.

    - **If none of the DTCs set**
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
7. Verify DTC P2122, P2123, P2127, P2128, or P2138 is not set.

   - **If any DTC sets**

     Refer to Circuit/System Testing.

   - **If no DTCs set**
8. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B107 accelerator pedal assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between each low reference circuit terminal listed below and ground:
   - Low reference circuit X1 terminal 4
   - Low reference circuit X1 terminal 3
   - **If 5 Ω or greater**
   1. Vehicle OFF, disconnect the harness connector at the K20 ECM.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 ECM.
   - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2V between each 5V reference circuit terminals listed below and ground:
   - 5V reference circuit terminal 1
   - 5V reference circuit terminal 6
   - **If less than 4.8V**
   1. Vehicle OFF, disconnect the harness connector at the K20 ECM.
   2. Test for infinite resistance between the 5V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 5V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 ECM.
   - **If greater than 5.2V**
   1. Vehicle OFF, disconnect the harness connector at the K20 ECM, vehicle in Service Mode.
   2. Test for less than 1V between the 5V reference circuit and ground.
      - If 1V or greater, repair the short to voltage on the circuit.
      - If less than 1V, replace the K20 ECM.
   - **If between 4.8 - 5.2V**
5. Verify each APP sensor voltage parameter is less than 0.2V.
   - **If 0.2V or greater**
   1. Vehicle OFF, disconnect the harness connector at the K20 ECM, vehicle in Service Mode.
   2. Test for less than 1V between the signal circuit terminal listed below and ground:
      - APP sensor 1 signal circuit terminal 5
      - APP sensor 2 signal circuit terminal 2
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 ECM.
   - **If less than 0.2V**
6. Install a 3A fused jumper wire between each signal circuit terminals listed below and the 5V reference circuit terminal 1:
   - APP sensor 1 signal circuit terminal 5
   - APP sensor 2 signal circuit terminal 2
7. Verify the scan tool APP sensor voltage parameter is greater than 4.8V.

- **If 4.8V or less**
  1. Vehicle OFF, disconnect the harness connector at the K20 ECM.
  2. Test for infinite resistance between the signal circuit terminal and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance
  3. Test for less than 2 Ω in the signal circuit end to end.
     - If 2 Ω or greater, repair the open/high resistance in the circuit.
     - If less than 2 Ω, replace the K20 ECM.
- **If greater than 4.8V**

8. Test or replace the B107 accelerator pedal assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Accelerator Pedal Assembly Replacement**
- Refer to **Control Module References** for K20 ECM replacement, programming, and setup.

DTC P2797: AUXILIARY TRANSMISSION FLUID PUMP PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P2797

Auxiliary Transmission Fluid Pump Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, utilizes a pulse-width modulated signal to control the auxiliary transmission fluid pump. The hybrid/EV powertrain control module 1 and the motor control module share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground.

Conditions for Running the DTC

- The vehicle is ON.
- The auxiliary transmission fluid pump is commanded greater than 800 RPM.

Conditions for Setting the DTC

The difference between desired and actual auxiliary transmission fluid pump speed is greater than 600 RPM for 30 seconds.

Action Taken When the DTC Sets

- DTC P2797 is a Type A DTC.
- Vehicle speed will be limited.
- Propulsion will be reduced.
- Propulsion Power is Reduced message will be illuminated.

Conditions for Clearing the DTC

DTC P2797 is a Type A DTC.

Diagnostic Aids

There should always be other hybrid/EV powertrain control module 1 or motor control module DTCs set along with DTC P2797. Always diagnose other DTCs before addressing this DTC.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Verify that no other hybrid/EV powertrain control module 1 or motor control module DTC is set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
2. Verify DTC P2797 is not set.
   - **If the DTC is set**
3. Verify the DTC does not set. If the DTC sets, replace the G5 Auxiliary Transmission Fluid Pump.
4. Verify the DTC does not set. If the DTC sets, replace the T6 Power Inverter Module.
   - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Transmission Fluid Pump Removal** for G5 Auxiliary Transmission Fluid Pump, often referred to as the A/Trans Aux Fluid Pump Motor, replacement.
- Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

DTC P2798 OR P2799: AUXILIARY TRANSMISSION FLUID PUMP CONTROL CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P2798

Auxiliary Transmission Fluid Pump Control Circuit Low Voltage

DTC P2799

Auxiliary Transmission Fluid Pump Control Circuit High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the motor control module and the hybrid/EV powertrain control module 1. The hybrid/EV powertrain control module 1 controls the auxiliary transmission fluid pump by providing a 12 V ground pulse width modulation (PWM) signal to the pump motor to request a specific motor speed.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

DTC P2798

The voltage at the hybrid/EV powertrain control module 1 output to the auxiliary transmission fluid pump control is open or shorted to ground for 4 seconds.

DTC P2799

The voltage at the hybrid/EV powertrain control module 1 output to the auxiliary transmission fluid pump control is shorted to voltage for 4 seconds.

Action Taken When the DTC Sets

- DTCs P2798 and P2799 are Type A DTCs.
- Vehicle speed will be limited, the Propulsion Power is Reduced message will be illuminated.

Conditions for Clearing the DTC

- DTCs P2798 and P2799 are Type A DTCs.
- The condition for setting the DTC is no longer present.

Diagnostic Aids

DTC P2798 may set under low 12V battery conditions. Always diagnose low 12V battery concerns first.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify no 12V battery system voltage LOW DTCs are set or that a low 12V battery condition was not present at the time the DTC was set.
    - **If any of the DTCs were set or a low 12V battery condition was present**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
    - **If the DTCs were not set or a low 12V battery condition was not present**
2. Verify no ECM loss of communication DTCs U0100/U1818 are set indicating that a KR75 Engine Controls Ignition Relay concern is present.
    - **If any of the DTCs were set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If the DTCs were not set**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC is not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G5 Transmission Fluid Pump Electric/Auxiliary.
2. Connect a test lamp between the enable circuit terminal 5 and the ground circuit terminal 6.
3. Vehicle OFF. Verify the test lamp is OFF.
    - **If the test lamp is ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
    2. Test for less than 1 V between the pump enable circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Replace the T6 Power Inverter Module.
    - **If the test lamp is OFF**
4. Vehicle ON, verify the test lamp illuminates. Command the Auxiliary Transmission Fluid Pump ON (20 - 70%) with a scan tool if necessary.
    - **If the test lamp is OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the T6 Power Inverter Module.
    2. Test for infinite resistance between the enable circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the enable circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω
    4. Replace the T6 Power Inverter Module.
    - **If the test lamp is ON**
5. Replace the G5 Transmission Fluid Pump Electric/Auxiliary.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Transmission Fluid Pump Removal for G5 Auxiliary Transmission Fluid Pump, often referred to as the A/Trans Aux Fluid Pump Motor, replacement.
- Refer to Control Module References for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, setup, and programming.

SYMPTOMS - HYBRID CONTROLS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the Diagnostic System Check - Vehicle before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions.

Refer to the following procedures:

- **Accessory DC Power Control Module Description and Operation**
- **Drive Motor Power Inverter Module Description and Operation**
- **Engine Control Module (ECM) Description and Operation**
- **Electromagnetic Compatibility Description**
- **High Voltage Monitoring Systems Description**
- **Hybrid Modes of Operation Description**
- **Drive Motor Battery System Description**
- **Transmission General Description**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Hybrid System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **DC Power Conversion Test**
- **Sport Mode Indicator Malfunction**

SPORT MODE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	Stuck in Normal Mode	Stuck in Normal Mode	Stuck in Normal Mode	P1762
Ground	Stuck in Normal Mode	Stuck in Normal Mode	Stuck in Normal Mode	P1762

Circuit/System Description

The body control module monitors the signal circuit from the Sport Mode switch. When the Sport Mode switch is pressed once, the body control module will request the ECM via serial data to enable Sport Mode. The ECM will request the instrument cluster via serial data to turn the Sport Mode indicator ON to notify the driver of the activation.

When the Sport Mode switch is pressed again, the body control module will request the ECM to disable the Sport Mode. The ECM will request the instrument cluster via serial data to turn the Sport Mode Off and the instrument cluster will display Normal to notify the drive of the deactivation. The Sport Mode switch is part of the S48E Multifunction Switch-Center Console and is not serviced separately.

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Sport Mode parameter in the ECM Hybrid/EV data list changes between Active and Inactive while pressing and releasing the Sport Mode switch.
    - **If the parameter does not change**

      Refer to Circuit/System Testing.

    - **If the parameter changes**
3. Replace the P16 Instrument Cluster.

Circuit/System Testing

1. Vehicle OFF, scan tool disconnected, and all vehicle systems OFF, disconnect the harness connector at the S48E Multifunction Switch-Center Console. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 10 and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Sport Mode parameter in the ECM Hybrid/EV data list is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X6 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 22 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 10.
6. Verify the scan tool Sport Mode parameter in the ECM Hybrid/EV data list is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X6 harness connector at the K9 Body Control Module, vehicle in service mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.

    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**

7. Test or replace the S48E Multifunction Switch-Center Console.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the S48E Multifunction Switch-Center Console.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 10 with the switch in the open position.
    - **If less than infinite resistance**

      Replace the S48E Multifunction Switch-Center Console.

    - **If infinite resistance**
3. Test for less than 2 Ω between the signal circuit terminal 2 and the ground terminal 10 with the switch in the closed position.
    - **If 2 Ω or greater**

      Replace the S48E Multifunction Switch-Center Console.

    - **If less than 2 Ω**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Instrument Cluster Replacement**
- Refer to **Front Floor Console Trim Plate Replacement** for S48E Multifunction Switch-Center Console replacement.
- Refer to **Control Module References** for body control module or instrument cluster replacement, programming and setup

DC POWER CONVERSION TEST

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

Circuit/System Description

The 14 V power module, often referred to as the accessory DC power control module, converts the high voltage (360 V) direct current (DC) to low voltage (14 V) DC to charge the 12 V battery and to operate the power accessories.

The ECM uses two circuits to control and monitor the state of the 14 V power module, often referred to as the accessory DC power control module.

The status circuit functions much like the F Terminal circuit on a generator equipped vehicle. A high side driver in the 14 V power module applies a duty cycled voltage to the ECM. The duty cycle indicates the 14 V power module internal temperature and operational condition.

The control circuit functions much like the L Terminal circuit on a generator equipped vehicle. A high side driver in the ECM applies a duty cycled voltage to the 14 V power module. The duty cycle controls the 14 V power module output.

The 14 V power module generates more power as the commanded duty cycle increases.

Diagnostic Aids

Using a carbon pile tester is the preferred method to test the 14 V power module. The carbon pile tester can put an increasing load on the system to reach a target current level. If a carbon pile tester is not available, the alternative method is using the scan tool 14 V power module setpoint.

Description and Operation

Accessory DC Power Control Module Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Testing for Intermittent Conditions and Poor Connections**

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P1F59, P1F5A, P1F5B, P1F5D, or P1F5E is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If the DTCs are not set**
3. Vehicle OFF. Measure and record the C1 battery voltage at the C1 battery terminals. The C1 battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the vehicle OFF.
    - **If not within the specified range**

      Refer to **Battery Inspection/Test** .

    - **If within the specified range**
4. Vehicle ON, accessories OFF.
5. Measure and record the C1 battery voltage at the C1 battery terminals. The voltage should be at least 1 V greater than the voltage measured in step 1 but less than 15 V.
    - **If not within the specified range**

      Refer to Circuit/System Testing.

    - **If within the specified range**
6. All OK.

Circuit/System Testing

NOTE: **If a carbon pile tester is available, refer to With Carbon Pile Tester section. Otherwise, refer to Without Carbon Pile Tester section.**

With Carbon Pile Tester

1. Vehicle ON.
2. Verify DTC P1F59, P1F5A, P1F5B, P1F5D, or P1F5E is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If the DTCs are not set**
3. Verify that no K1 14 V Power Module or B18 Battery Current Sensor DTCs are set that would cause a charging system concern.
    - **If an applicable DTC is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no applicable DTCs are set**
4. Vehicle OFF.
5. Test for 12.4 V or greater at room temperature across the C1 Battery terminals.
    - **If not within the specified range**

      Refer to **Battery Inspection/Test** .

    - **If within the specified range**
6. Connect a carbon pile tester to the C1 Battery.
7. Vehicle ON, turn all accessories off. Observe the voltage reading on the tester. The voltage should read between 12.6 - 15.5 V.
8. Adjust the carbon pile tester so that the Low - Voltage Battery Current parameter on the 14 V Power Module data list of the Engine Control Module is reading 125 amps.
9. Verify the voltage reading remains between 12.6 - 15.5 V.
    - **If not within the specified range**
    1. Disconnect the X2 harness connector at the 14 V power module, vehicle ON.
    2. Test for 3.0 - 5.5 V between the control circuit terminal X2-01 and ground.
        - If less than 3.0 V
        1. Vehicle OFF, disconnect the harness connectors at the K20 ECM.
        2. Test for less than 2 Ω in the control circuit end to end.
            - If greater than 2 Ω, repair the open/high resistance in the circuit.
            - If less than 2 Ω
        3. Replace the K20 ECM.
        - If within 3.0 - 5.5 V
    3. Replace the K1 14 V Power Module.
    - **If within the specified range**
10. All OK.

Without Carbon Pile Tester

1. Vehicle ON.
2. Verify DTC P1F59, P1F5A, P1F5B, P1F5D, or P1F5E is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If the DTCs are not set**
3. Verify that no K1 14 V Power Module or B18 Battery Current Sensor DTCs are set that would cause a charging system concern.
    - **If an applicable DTC is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no applicable DTCs are set**

4. Vehicle OFF.
5. Test for 12.4 V or greater at room temperature across the C1 Battery terminals.
    - **If not within the specified range**

      Refer to **Battery Inspection/Test** .

    - **If within the specified range**
6. Vehicle ON.
7. Verify the scan tool Engine Control Module Ignition 1 Signal parameter continually increases when controlling the Engine Control Module 14 V Power Module Setpoint from 10 - 80% with a scan tool. It may take up to 10 s for the battery voltage to stabilize between each setpoint change.
    - **If the battery voltage does not continually increase**
    1. Disconnect the X2 harness connector at the 14 V power module, vehicle ON.
    2. Test for 3.0 - 5.5 V between the control circuit terminal X2-01 and ground.
        - If less than 3.0 V
        1. Vehicle OFF, disconnect the harness connectors at the K20 ECM.
        2. Test for less than 2 Ω in the control circuit end to end.
            - If greater than 2 Ω, repair the open/high resistance in the circuit.
            - If less than 2 Ω
        3. Replace the K20 ECM.
        - If within 3.0 - 5.5 V
    3. Replace the K1 14 V Power Module.
    - **If the battery voltage continually increases**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K1 14 V Power Module, often referred to as the Accessory DC Power Control Module, replacement, programming, and setup.

REPAIR INSTRUCTIONS

ENGINE CONTROL MODULE REPLACEMENT

Removal Procedure

CAUTION:

- **Turn the ignition OFF when installing or removing the control module connectors and disconnecting or reconnecting the power to the control module (battery cable, powertrain control module (PCM)/engine control module (ECM)/transaxle control module (TCM) pigtail, control module fuse, jumper cables, etc.) in order to prevent internal control module damage.**
- **Control module damage may result when the metal case contacts battery voltage. DO NOT contact the control module metal case with battery voltage when servicing a control module, using battery booster cables, or when charging the vehicle battery.**
- **In order to prevent any possible electrostatic discharge damage to the control module, do no touch the connector pins or the soldered components on the circuit board.**
- **Remove any debris from around the control module connector surfaces before servicing the control module. Inspect the control module connector gaskets when diagnosing or replacing the control module. Ensure that the gaskets are installed correctly. The gaskets prevent contaminant intrusion into the control module.**
- **The replacement control module must be programmed.**

1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection

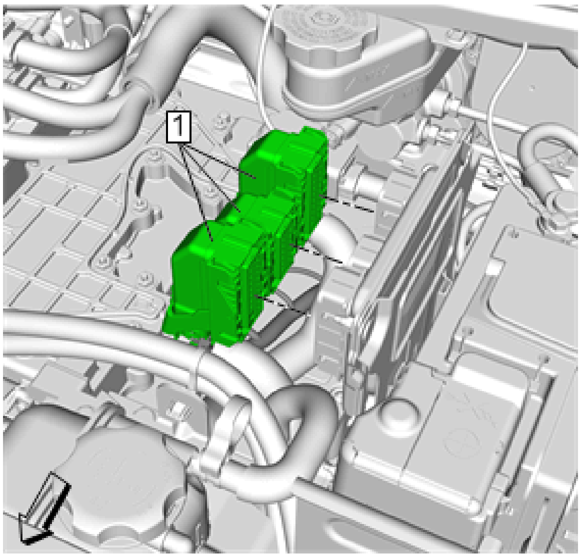

Fig. 10: Engine Control Module Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Engine Control Module Electrical Connectors (1) (Qty: 3)

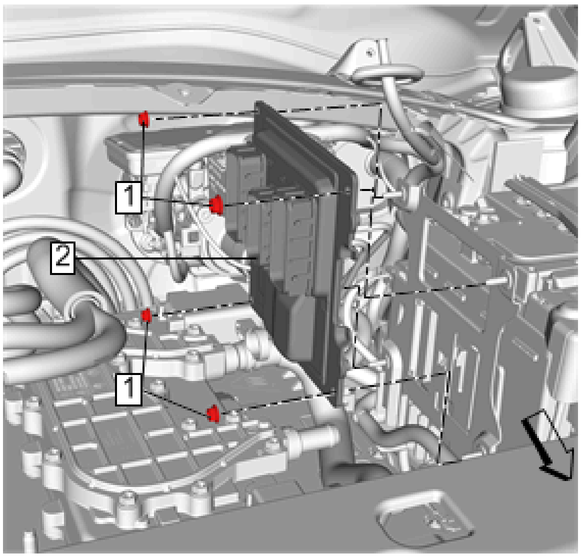

Fig. 11: Engine Control Module And Bracket Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Remove Engine Control Module Bracket Nuts (1) (Qty: 4)
4. Remove Engine Control Module (2)

Installation Procedure

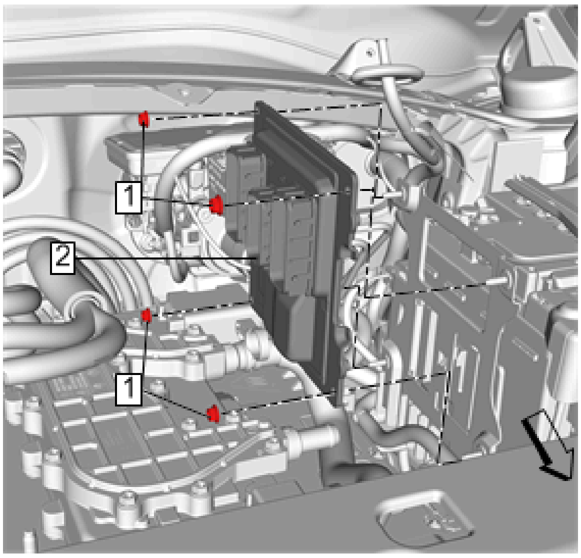

Fig. 12: Engine Control Module And Bracket Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Using a flat bladed tool, release the ECM bracket retainer. Slide the ECM and bracket assembly to the battery tray.
2. Install Engine Control Module (2)

CAUTION: **Refer to Fastener Caution**

3. Install and tighten Engine Control Module Bracket Nuts (1) (Qty: 4) to 4.7 N.m (42 lb in)

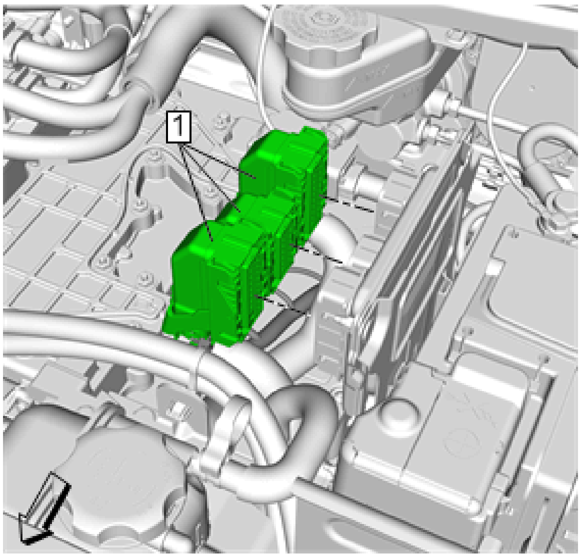

Fig. 13: Engine Control Module Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

4. Connect Engine Control Module Electrical Connectors (1) (Qty: 3)
5. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection
6. If replacing the engine control module, reprogram the module. Refer to Control Module References

DRIVE MOTOR POWER INVERTER MODULE 3 PHASE CABLE REPLACEMENT

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. Refer to High Voltage Disabling
2. Remove Drive Motor Rear Mount Bracket. Refer to Drive Motor Rear Mount Bracket Replacement

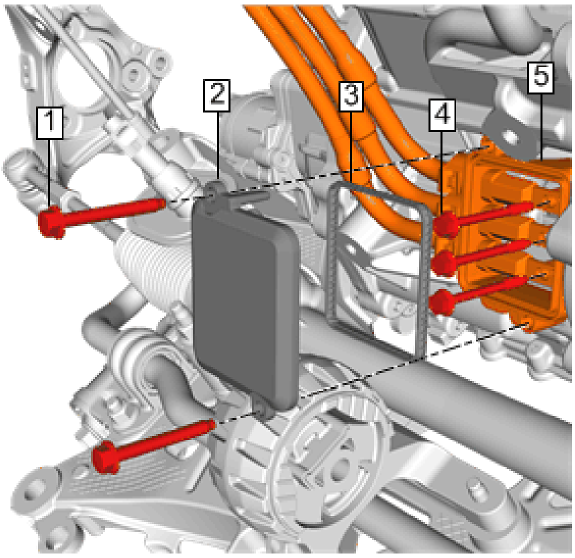

Fig. 15: Drive Motor Power Inverter Module 3-Phase Cable Connector Cover, Bolts And Seal
Courtesy of GENERAL MOTORS COMPANY

3. Remove Drive Motor Power Inverter Module 3-Phase Cable Connector Cover Bolts (1) (Qty: 2)
4. Remove Drive Motor Power Inverter Module 3-Phase Cable Connector Cover (2)
5. Remove and DISCARD Drive Motor Power Inverter Module 3-Phase Cable Connector Cover Seal (3)
6. Loosen Drive Motor Power Inverter Module 3-Phase Cable Bolts (4) (Qty: 3)

20. Install Engine Wiring Harness Bracket Bolt (1) @ Accessory DC Power Control Module (3) and tighten to 22 N.m (16 lb ft)
21. Install High Voltage Battery Control Wiring Junction Block. Refer to **High Voltage Battery Control Wiring Junction Block Replacement (With quick charge)High Voltage Battery Control Wiring Junction Block Replacement (Without quick charge)**
22. Install Radiator Surge Tank Support Bracket (RESS). Refer to **Radiator Surge Tank Support Bracket Replacement (Radiator) Radiator Surge Tank Support Bracket Replacement (Heater) Radiator Surge Tank Support Bracket Replacement (RESS)**
23. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
24. Enable the high voltage system. Refer to **High Voltage Enabling**
25. Program the Drive Motor Power Inverter Module. Refer to **Control Module References**

HIGH VOLTAGE BATTERY CONTROL WIRING JUNCTION BLOCK REPLACEMENT (WITH QUICK CHARGE)

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable High Voltage System. Refer to **High Voltage Disabling**

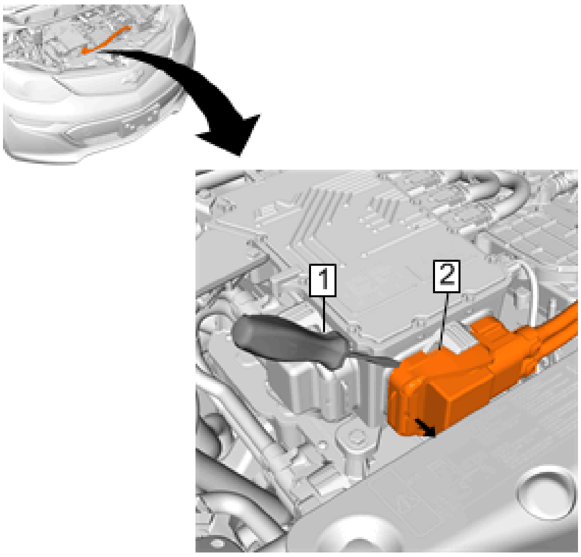

Fig. 33: Flat Blade Screwdriver And Connector Handle Lock
Courtesy of GENERAL MOTORS COMPANY

2. Using a flat blade screwdriver (1), pry the edge of the connector handle lock (2) from the holding tab.
3. Release the connector handle lock by rotating the connector handle forward.
4. With the connector handle in the release position, disconnect the high voltage charger connector, from the high power distribution module.

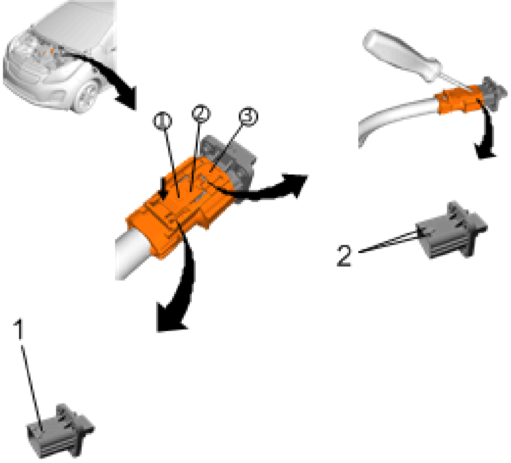

Fig. 34: First Stage Connector Tab And Connector Retaining Tabs
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the 2-stage high voltage connectors in the following sequence:
   - Push down on the connector tab and release the connector from the first stage connector tab (1).
   - Using a flat blade screwdriver inserted into the connector as shown, release the second stage safety catch, from the 2 connector retaining tabs (2).

DESCRIPTION AND OPERATION

ACCESSORY DC POWER CONTROL MODULE DESCRIPTION AND OPERATION

Location

The 14 V power module, also called the accessory DC power control module, is located in the in the front compartment. The 14 V power module is cooled with pre-mixed DexcoolÃ‚Â® circulating through a cooling system that is separate from the engine cooling system.

Operating Functions

The 14 V power module is an electronic device that takes the place of the generator on a traditional vehicle. On a hybrid or electric vehicle the 14 V power module converts high voltage (300 V) direct current (DC) to low voltage (12 V) DC for accessory electrical operation and to charge the 12 V battery.

Normally, the 14 V power module only supplies 12 V DC when the vehicle is under a normal drive cycle. However there are certain instances when the vehicle is being charged through a standard wall socket where the 14 V power module operation is required to sustain the 12 V battery.

The 14 V power module is capable of supplying up to 130 Amps of 12 V DC.

Communication and Hosted Diagnostics

The 14 V power module has no internal diagnostic tests and does not communicate over serial data. The engine control module (ECM) monitors and controls the 14 V power module and will report DTCs if a fault is detected.

Circuit Inputs

Inputs to the 14 V power module include the high voltage and 12 V circuits. The 14 V power module also has a pulse width modulated set point input from the engine control module (ECM). This input enables conversion of voltage from high to the desired 12 V output level.

For more information on the 12 V Battery Charging System, refer to **Charging System Description and Operation** .

Circuit Outputs

The only outputs supported by the 14 V power module are the status feedback circuit to the engine control module (ECM) and 12 V DC which powers the 12 V components in the vehicle and charges the 12 V battery. Low voltage 12 V cables on the hybrid/EV vehicle do not require unique coloring or servicing procedures.

DRIVE MOTOR POWER INVERTER MODULE DESCRIPTION AND OPERATION

Overview

The power inverter module, often referred to as the drive motor generator power inverter module, converts high voltage direct current (DC) electrical energy to 3 phase alternating current (AC) electrical energy. The power inverter module contains the motor control module and the hybrid/EV powertrain control module 1. The motor control module operates the drive motor based upon power inverter module commands. The hybrid/EV powertrain control module 1 also controls the auxiliary transmission fluid pump using a Pulse Width Modulated (PWM) signal. The hybrid/EV powertrain control module 1 and the motor control module share the power inverter module ignition voltage circuit, battery voltage circuits and chassis ground. The modules are flash-programmable micro-processors. The power inverter module is cooled with pre-mixed DexcoolÃ‚Â® circulating through a cooling system that is separate from the engine cooling system. The hybrid cooling system utilizes a heat exchanger at the front of the vehicle and electric pumps to circulate the coolant. The ECM monitors a temperature sensor in the hybrid cooling system and operates the radiator fan and the hybrid coolant pumps in response to system temperature.

High Voltage Circuits

Direct Current (DC)

The power inverter module is connected to the positive and negative terminals of the high voltage DC hybrid/EV battery pack. Both of the negative and positive high voltage DC battery poles are isolated from the vehicle chassis by a specific amount of resistance. Each high voltage DC bus is switched ON or OFF by a high voltage, high current contactor relay contained within the hybrid/EV battery pack. All high voltage DC negative and positive DC cables are individually shielded and orange in color to alert the technician to the potential presence of high voltage. The electric air conditioning compressor receives high voltage from DC cables connected to the battery charger DC.

Three Phase Alternating Current (AC)

Three individual cables connect each phase of the drive motor to the power inverter module. Each individually shielded cable is orange in color to alert the technician to the potential presence of high voltage. A harness connects the auxiliary transmission fluid pump to the power inverter module. This harness contains individual wires that are connected to the 3 phases of the auxiliary transmission fluid pump, and is orange in color to alert the technician to the potential presence of high voltage.

Low Voltage Circuits

The 14 V power module, also called the accessory DC power control module, is the device which converts high voltage (300V) DC to low voltage (12V) DC for accessory electrical operation and to charge the 12 V accessory battery.

Low Voltage (12V) Direct Current

Low voltage (12V) cables on the hybrid-electric vehicle do not require unique coloring or servicing procedures.

Hybrid Powertrain Control Module

Location

The hybrid/EV powertrain control module 1 is a non-serviceable, flash-programmable micro-processor contained within the power inverter module.

Operating Functions

The hybrid/EV powertrain control module 1 is the main controller of powertrain operation. The hybrid/EV powertrain control module 1 determines when to perform normal operating modes such as electric mode and regenerative braking. The hybrid/EV powertrain control module 1 also operates in conjunction with the hybrid/EV powertrain control module 2 to determine when to enable and disable the DC high voltage circuits. The hybrid/EV powertrain control module 2 is external to the drive motor generator power inverter module.

Communication and Hosted Diagnostics

The hybrid/EV powertrain control module 1 is the host controller for DTC information for the Drive motor 1 control module.

The module diagnoses its own operation and determines when a fault condition is present.

The motor control module and the hybrid/EV powertrain control module 1 exchange information and commands on a serial peripheral interface bus internal communication circuit as well as the hi-speed hybrid GMLAN communication circuit.

In the event a hosted module communicates a fault condition, the hybrid/EV powertrain control module 1 will determine if one or more operating modes are affected and notify the vehicle operator by requesting the MIL illuminate and/or by displaying a message in the Driver Information Center. In addition, the hybrid/EV powertrain control module 1 will store the associated DTC information for retrieval by a scan tool. Some hosted modules may require an ignition cycle to clear certain DTCs from the hybrid/EV powertrain control module 1.

Circuit Inputs

In addition to data parameters, the hybrid/EV powertrain control module 1 directly monitors the following signal circuits:

- Transmission internal mode switch direction and Park/Neutral switch signals
- High voltage interlock circuit

Motor Control Module

Location

The drive motor and the auxiliary transmission fluid pump motor are located within the transmission. The drive motor is controlled by the motor control module. The motor control module is contained within the power inverter module. Also contained within the power inverter module is the hybrid/EV powertrain control module 1 micro-processor.

Operating Functions

The motor control module operates the motor based upon hybrid/EV powertrain control module 1 commands. the motor control module controls the speed, direction, and output torque of the drive motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors.

Communication and Hosted Diagnostics

In addition to the internal serial peripheral interface bus communication circuit that the hybrid/EV powertrain control module 1 and the motor control module control use to communicate, the motor control module also communicates on the hi-speed and hybrid serial data circuits. The motor control module does not store its own Diagnostic Trouble Code (DTC) information. The hybrid/EV powertrain control module 1 will store motor control module associated DTC information for retrieval by a scan tool.

Circuit Inputs

In addition to data parameters, the motor control module monitors its respective motor for voltage, current, speed, direction and temperature. Additionally, the motor control module monitors the insulated gate bipolar transistor components for temperature and proper operation. Some of the motor control module operation data is shared with the hybrid/EV powertrain control module 1.

Circuit Outputs

The motor control module controls its respective insulated gate bipolar transistor driver board that in-turn controls the motor. The motor operates using 3 - phase AC electricity. Three cables connect the drive motor to the power inverter module. Each individually shielded cable is orange in color to alert the technician that the potential for high voltage is present.

ENGINE CONTROL MODULE (ECM) DESCRIPTION AND OPERATION

The ECM on this vehicle is also called an engine control module and is used in electric, hybrid, and conventional vehicle applications. The ECM interacts with many related components and systems, and monitors them for deterioration. Diagnostics monitor the system performance and a diagnostic trouble code (DTC) sets if the system performance degrades. The ECM is part of a network and communicates with various other vehicle control modules.

Malfunction indicator lamp (MIL) operation and DTC storage are dictated by the DTC type. A DTC is ranked as a Type A, B, or C DTC. Refer to **Powertrain Diagnostic Trouble Code (DTC) Type Definitions** . Other system control modules may request the ECM to illuminate the MIL. In these cases there is no fault with the ECM, and a DTC will set in the ECM indicating which control module requested the MIL illumination.

The ECM is the control center of the some of the vehicle control systems. Review the components and wiring diagrams in order to determine which systems are controlled by the ECM.

The ECM constantly monitors the information from various sensors and other inputs, and controls the systems that affect vehicle performance. The ECM also performs diagnostic tests on various parts of the system and may illuminate the MIL when it detects a malfunction that affects vehicle performance. When the ECM detects a malfunction, the ECM stores a DTC. The condition area is identified by the particular DTC that is set. This aids the technician in making repairs.

ECM Function

The ECM can supply 5V or 12V to various sensors or switches. This is done through pull-up resistors to regulated power supplies within the ECM. During testing, a digital multimeter (DMM) with at least 10 megaohms input impedance is required in order to ensure accurate voltage readings.

The ECM controls the output circuits by controlling the ground or the voltage circuit through transistors or a device called a high side or low side driver.

EEPROM

The electronically erasable programmable read only memory (EEPROM) is an integral part of the ECM. The EEPROM contains program and calibration information that the ECM needs in order to control engine operation.

Special equipment, as well as the correct program and calibration for the vehicle, are required in order to reprogram the ECM, refer to **Control Module References** for ECM replacement, programming, and setup.

Data Link Connector (DLC)

The data link connector (DLC) provides serial data communication for ECM and vehicle diagnosis. This connector allows the technician to use a scan tool in order to monitor various serial data parameters, and display DTC information. The DLC is located on the left side of the driver's compartment, underneath the instrument panel.

Malfunction Indicator Lamp (MIL)

The electric vehicle malfunction indicator lamp (MIL) is displayed in the instrument panel cluster (IPC) during bulb check or if a fault has been detected. The MIL is controlled by the ECM and illuminates when the ECM detects a condition that affects vehicle performance or when another module on the vehicle requests MIL illumination.

ECM Service Precautions

The ECM is designed to withstand normal current draws that are associated with normal vehicle operations. However, care must be used in order to avoid overloading any of these circuits. When testing for opens or shorts, do not ground or apply voltage to any of the ECM circuits unless the diagnostic procedure instructs you to do so. These circuits should only be tested with a DMM unless the diagnostic procedure instructs otherwise.

Aftermarket (Add-On) Electrical Equipment

CAUTION: **Connect any add-on electrically operated equipment to the vehicle's electrical system at the 12 V battery (power and ground) in order to prevent damage to the vehicle.**

Add-on electrical equipment, even when installed to these strict guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system, such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain condition is to eliminate all of the aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, the problem may be diagnosed in the normal manner.

Electrostatic Discharge (ESD) Damage

NOTE: **In order to prevent possible electrostatic discharge damage to the ECM, DO NOT touch the connector pins on the ECM.**

The electronic components that are used in the control systems are often designed to carry very low voltage. These electronic components are susceptible to damage caused by electrostatic discharge. Less than 100V of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 V for a person to even feel a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat.

Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

ELECTROMAGNETIC COMPATIBILITY DESCRIPTION

Overview

Vehicles are typically subject to certain legal requirements that limit the amount of electromagnetic interference (EMI) that can be generated by the vehicles electronic devices. Additionally, the electronic devices within the vehicle must be able to withstand a certain amount of EMI without affecting their operation. EMI is generated whenever electrical current flows through a circuit. The amount of EMI generated, or amplitude, is usually dependent upon the amount of current flow, amperage, and the on-off pattern of current flow through the circuit, frequency. The EMI requirements are generally referred to as electromagnetic compatibility.

There are many ways of ensuring the vehicle meets electromagnetic compatibility requirements. These include:

- Adding capacitors and resistors to certain electrical circuits
- Regulating the frequency at which a component may operate
- Shielding the wires, cables and components

Circuit Design

The power inverter module, often referred to as the drive motor generator power inverter module, and the 14 V power module, often referred to as the accessory DC power control module, each contain filter capacitors connected to the high voltage circuits. These capacitors are necessary to reduce the voltage spikes that occur as a result of the switching of current On and Off. Reducing voltage spikes reduces EMI. The frequency of current switching is also closely regulated. Too high a frequency can cause an increase in EMI generation.

Wiring/Cable Design

Different types of wire/cable shielding methods are utilized in the vehicle. Common types of circuit shielding include twisted-pair and internal braid or foil. Twisted pair is typically used in circuits such as serial data circuits. The wire pair is twisted together at a particular turns-per-length ratio. Shielded cable is utilized for all other circuits requiring either protection from external EMI or to reduce EMI radiation of the cable itself into other nearby components or circuits.

High Voltage Cable

- 300-Volt Battery Positive and Negative Cable

- Drive Motor Generator Power Inverter Module 3 Phase Cable Assembly
- Air Conditioning and Drive Motor Battery Cooling Compressor

The high voltage cables utilize internal braid shielding. Typically, both ends of the internal braid shield are attached to chassis ground. All of the high voltage, internally shielded cables are grounded at their cable end attachment points. Mounting blocks, where used, perform the shield to chassis ground connection. Connection points not serviced with a mounting block utilize a separate ring terminal.

Low and Intermediate Voltage Wiring

The signal circuits for the transmission sensors utilize shielding protection. The drive motor position sensor circuits utilize internal foil shielding. The wiring harness external of the transmission assembly is connected to chassis ground with ring terminals at the power inverter module. The internal transmission wiring harness is attached to chassis ground with a ring terminal at the valve body assembly.

The auxiliary transmission fluid pump 3 phase cables utilize internal foil shielding. The wiring harness shield is connected to chassis ground within the power inverter module.

Component Shielding

Certain components utilize their structure to effectively shield EMI. Metal covers, chassis grounded metal cases and electro-magnetically conductive gaskets may all be part of a components electromagnetic compatibility design.

Shielding Loss

A loss of proper shielding may result in poor AM band radio reception and/or incorrect sensor circuit readings depending upon the location of the shield loss. Damage that has penetrated to the insulated conductor of high voltage cables is not repairable. Minor damage to the outer sheathing can be repaired, refer to **Drive Motor Power Inverter Module 3 Phase Cable Inspection** . Certain Low and Intermediate voltage shielded wiring harnesses may be repairable. Refer to **Wiring Repairs** , and **Splicing Twisted or Shielded Cable** .

HIGH VOLTAGE MONITORING SYSTEMS DESCRIPTION

The hybrid/EV system monitors several high voltage components for attempted access. Additionally, a minimum amount of isolation resistance is maintained at all times between both negative and positive poles of the hybrid/EV battery and the vehicle chassis. Microprocessors internal to the power inverter module, often referred to as the drive motor generator power inverter module, and the hybrid/EV powertrain control module 2 monitor the hybrid/EV system for access and loss of isolation.

High Voltage Interlock Circuit

The high voltage interlock circuit is a wire loop that passes through certain high voltage components. The high voltage interlock circuit is used to determine if access to high voltage components is being attempted. The opening of these high voltage components causes the high voltage interlock circuit to open. The hybrid/EV system may react to the loss of high voltage interlock circuit continuity by opening the high voltage contactor relays and discharging the high voltage capacitors. The high voltage interlock circuit signal is generated by the hybrid/EV powertrain control module 2. The high voltage interlock circuit status is monitored by the hybrid/EV powertrain control module 2, the hybrid/EV powertrain control module 1, and each drive motor control module.

High Voltage DC Chassis Isolation

The hybrid/EV system monitors the electrical potential between each high voltage bus and the vehicle chassis. High voltage should always be isolated from the vehicle chassis by a certain amount of resistance to avoid the potential for a life threatening current path. In the event that a high voltage leak path to the vehicle chassis is detected, the hybrid/EV system will set a diagnostic trouble code (DTC). High voltage DC chassis isolation is monitored by the drive motor control modules and the hybrid/EV powertrain control module 2.

Testing for loss of isolation requires special tools and procedures. Because of the high voltage present in the hybrid/EV system, a loss of isolation may occur due to insulation breakdown. Insulation breakdown typically occurs only when high voltages and/or current is present. Conditions such as insulation breakdown cannot be diagnosed with a typical DMM because high voltage is not used by the DMM when measuring resistance.

HYBRID MODES OF OPERATION DESCRIPTION

Vehicle Operating Modes Description

This vehicle is a Battery Electric Vehicle. It uses only an electric propulsion system to drive the vehicle at all times. Electricity is the vehicle's only source of energy.

Electric Mode

Electric Mode is the only mode of operation for this vehicle. The vehicle is powered by electrical energy stored in the high voltage hybrid/EV battery pack. The vehicle will operate in this mode until the high voltage battery has reached a low state of charge.

Service Mode

Service Mode is available for service and diagnostics and to verify the proper operation of the MIL and may be required for emission inspection purposes. With vehicle OFF, and the brake pedal not applied, pressing and holding the POWER button for more than 5 seconds will place the vehicle in Service Mode. The instruments and audio systems will operate as they do in ON, but the vehicle will not be able to be driven. The propulsion system will not start in Service Mode.

Regenerative Braking

When the vehicle is coasting or braking, the drive motor generator power inverter module may operate the drive motor as a generator in an Electrical Generation Mode. Operating as an electrical generator, the drive motor exerts a driveline load that helps to slow the vehicle. The electrical energy that the drive motor creates is transferred by the drive motor generator power inverter module to the hybrid/EV battery pack. Constant communication between the drive motor generator power inverter module and the electronic brake control module allows the blending of regenerative braking force with hydraulic braking force.

Overview

The high voltage hybrid/EV battery contains 288 individual lithium-ion cells. Three cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid/EV battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at

3.65 V, for a nominal system voltage of 350 V direct current. The battery cell groups are electrically joined to form 10 distinct electrical modules. There are eight electrical modules comprised of 10 cell groups and two electrical modules comprised of 8 cell groups. Two battery cell modules are physically mounted together to form a section/row. Section/row 1 and 3 are interchangeable while section/row 2, 4 and 5 are unique to their location. With the exception of section/row 5, the two battery cell modules are not electrically connected within their respective section/row. The hybrid/EV battery pack contains a total of six battery temperature sensors mounted to certain battery cell modules. The hybrid/EV battery pack also contains a coolant inlet temperature sensor. Refer to **Hybrid/EV Cooling System Description and Operation** .

Located within the high voltage Hybrid/EV battery pack, the K16 battery energy control module monitors the temperature, current and voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the end of the battery cell module. A voltage sense harness joins this connector to the K16 battery energy control module.

The K16 battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the K16 battery energy control module to the K114B hybrid powertrain control module 2 through serial data. The K114B hybrid powertrain control module 2 is the host controller for K16 battery energy control module diagnostic trouble code information.

Location

The high voltage hybrid/EV battery is installed from beneath the vehicle. The K16 battery energy control module, a current sensor, and the high voltage contactors are located within the hybrid battery assembly. The K114B hybrid powertrain control module 2 is mounted within the passenger compartment, beneath the right front seat.

High Voltage Control

The hybrid/EV battery contains 4 high voltage contactors. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor and a precharge negative high voltage contactor. The high voltage contactors are located within the A28 hybrid/EV battery contactor assembly.

In order to prevent large in-rush current to capacitors located in the vehicles high voltage components, the contactors close in a specific precharge sequence controlled by the K114B hybrid/EV powertrain control module 2.

Contactor Close Sequence (Precharge)

1. Plug-In Charge Positive Contactor
2. Main Positive Contactor
3. Precharge Negative Contactor

NOTE: **Wait for bus high voltage to attain almost the same level as hybrid/EV battery voltage.**

4. Main Negative Contactor
5. The precharge contactor opens when bus voltage and hybrid/EV battery voltage are equal.

Thermal Management

The hybrid/EV battery is cooled and heated with pre-mixed DEX-COOLÂ®, which is a 50/50 mixture of DEX-COOLÂ® and de-ionized water. A refrigerant/coolant heat exchanger (chiller) and the G1 A/C compressor cools down the high voltage hybrid/EV battery. A high voltage heater can also heat the coolant entering the hybrid/EV battery when needed. Thermal transfer occurs between the bottom of the Hybrid/EV Battery Modules and coolant plates that circulate the heated or cooled coolant. Refer to **Hybrid/EV Cooling System Description and Operation** , and **Disassembled Views** in Hybrid/EV Energy Storage.

HYBRID/EV SYSTEM HIGH VOLTAGE ISOLATION DESCRIPTION

Loss of Isolation Description

Vehicles equipped with high voltage storage and propulsion capability are designed with the high voltage circuits isolated from the vehicle chassis. If either the positive or negative high voltage Direct Current (DC) circuits or any of the high voltage Alternating Current (AC) phase circuits lose this isolation to the vehicle chassis, one or more diagnostic trouble codes (DTCs) may set.

Similar to typical 12V vehicle systems, loss of isolation can be as simple as a direct conductor-to-chassis short. Unlike 12V systems however, the potential within high voltage systems means that insulation breakdown is also a cause for loss of isolation. Therefore diagnosis for isolation loss requires testing with high voltage potential. Special insulation testing meters that utilize their own built-in high voltage are used to test the isolation capability of high voltage components and circuits. Additionally, monitoring certain scan tool parameters when high voltage is active may also help to identify which high voltage components and circuits may have lost their chassis isolation.

Vehicle Loss of Isolation Detection

The vehicle performs two independent tests for isolation:

1. Passive isolation testing which is performed within the power inverter module by the hybrid powertrain control module 1.
2. Active isolation testing which is performed within the Hybrid/EV battery pack by the hybrid powertrain control module 2.

Passive Isolation Testing

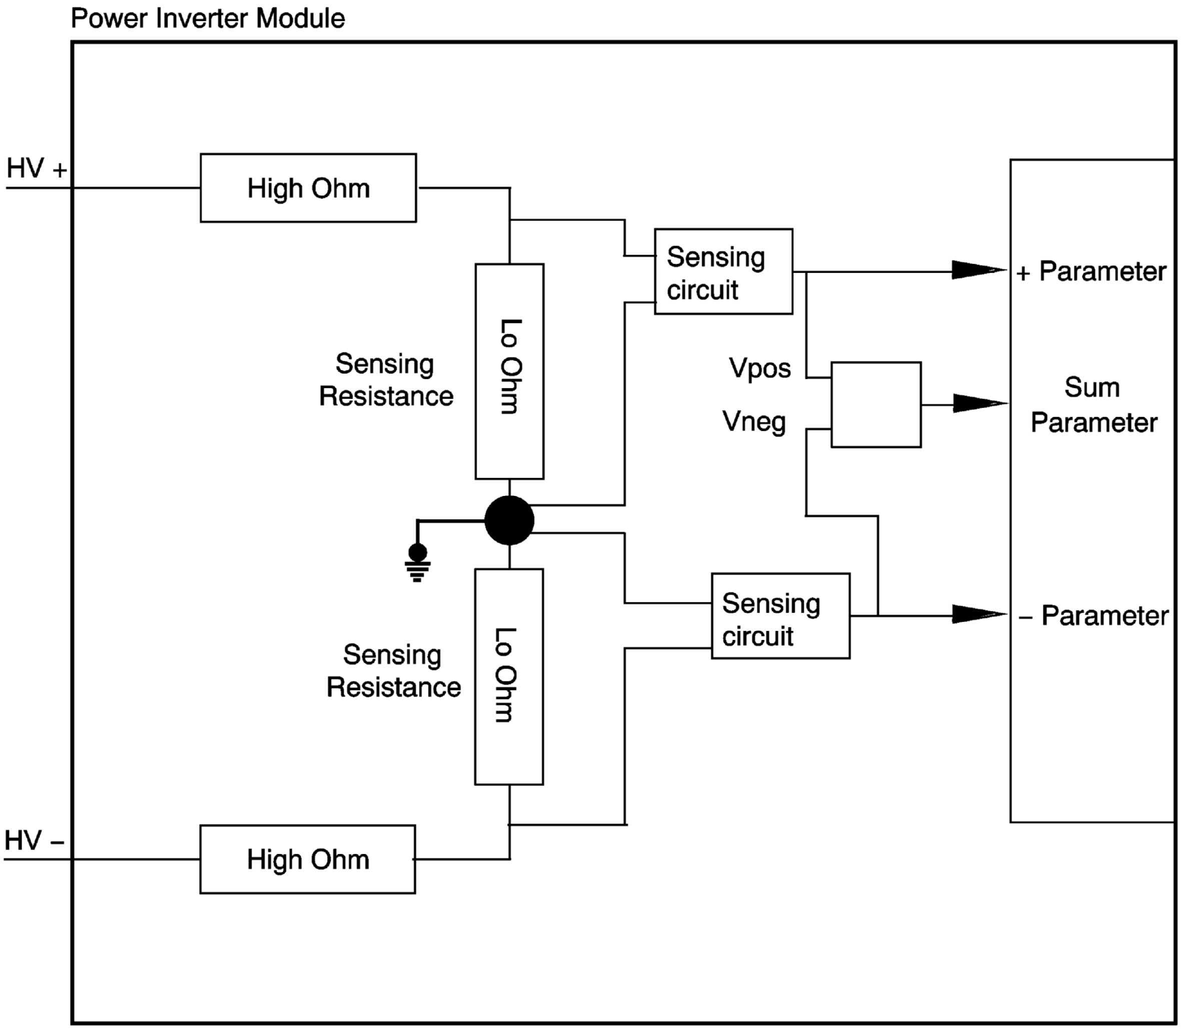

Fig. 3: Power Inverter Module Operation Graph
Courtesy of GENERAL MOTORS COMPANY

The power inverter module continuously performs isolation testing whenever high voltage to the module is present. The power inverter module has one isolation sensing circuit although the drive motor and aux pump control modules monitor and display the sensor data redundantly. The Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters give a real-time indication of Isolation status. Under normal operating conditions each of the parameters will indicate about half of the total Hybrid/EV battery pack high voltage potential. When a loss of isolation condition is observed, the Voltage scan tool parameter values will shift in respect to each other. When the voltage shift exceeds a set ratio, DTCs P1AF0, P1AF2, or P1E22 will set.

NOTE: **Some high voltage components contain internal switching or inverter circuits that can interrupt a portion of their high voltage circuitry. If such a component, for example the passenger cabin heater, is OFF its complete internal circuitry is not being monitored. Likewise, these internally switched components cannot be fully tested off-vehicle with the Insulation Testing Meter EL-50772 , EL-50774 , or equivalent.**

Scan Tool Parameters

- Drive Motor Positive Supply Isolation Voltage
- Aux Trans Fluid Pump Positive Supply Isolation Voltage
- Drive Motor Negative Isolation Voltage
- Aux Trans Fluid Pump Negative Supply Isolation Voltage

The power inverter module isolation sensing circuit communicates one value, which is displayed redundantly by different modules. The data within the parameters for each module is identical.

Isolation Loss between HV Components and Chassis, Positive Side*

Isolation between HV Bus and Chassis	Normal Vehicle	10M	5M	1M	500K	200K Approximate DTC set	100K	None - Direct Short
Positive Isolation Parameter*	198V	180V	165V	110V	75V	35V	20V	0V
Negative Isolation Parameter*	192V	210V	225V	280V	315V	355V	370V	390V
Difference Between Parameters	0 - 15V	30V	60V	170V	240V	320V	350V	390V
*Typical values observed with a fully charged pack, 390V. A short to the positive bus is shown, a short to the negative bus would display inverted voltages of similar value.								

Active Isolation Testing

Active isolation testing is dedicated to monitoring the internal Hybrid/EV battery pack HV circuits. The battery energy control module switches fixed resistors between the high voltage system and vehicle chassis. The difference between the switched-to-chassis and the unswitched state is used to calculate a resistance-to-chassis value. When resistance-to-chassis decreases below a set value, DTC P0AA6 will set.

Active isolation testing occurs when the main high voltage contactor relays are open. For this reason most testing of the Hybrid/EV battery pack occurs just after the vehicle is shut off following a drive trip. The Isolation Test Resistance scan tool parameter indicates the resistance-to-chassis calculation determined when the last Active isolation test was performed.

2017 ELECTRICAL

Hybrid/EV Energy Storage - Diagnostic Information and Procedures - Bolt EV

DIAGNOSTIC INFORMATION AND PROCEDURES

HIGH VOLTAGE SAFETY

The High Voltage Safety procedure will perform the following tasks:

- Identify precautions when performing service or inspections.
- Identify labels for components, wire harness, and connectors.
- Identify high voltage insulation glove inspection procedure.

When applicable, additional region-specific high voltage service requirements and/or Dangers will be located in the General Information, Safety Regulations service category and take precedence over the information presented here.

General High Voltage Dangers

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **For European Region, a face shield is required in place of safety glasses.**

WARNING: **High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.**

NOTE: **For European Region, a special voltage tester such as the EL-52229 may be required. A multimeter that can measure current is prohibited.**

WARNING: **This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.**

Failure to follow the procedure exactly as written may result in serious injury or death.

Precautions when Performing Service or Inspections

- Always verify that the high voltage has been disabled before working on or around high voltage components, wires, cables, or harnesses.
- Remove all metal objects such as rings and watches.
- The **EL-48900** HEV safety kit contains safety cones. Place the safety cones around the vehicle to alert other technicians that you are working on the high voltage system.
- Remove all keyless entry transmitters and the manual service disconnect from the vehicle and secure in a place outside the vehicle.
- Always wear certified and tested high voltage insulation gloves when inspecting or testing any high voltage wires and components.
- Use the "One Hand" rule whenever possible:
  - Work with only one hand.
  - Keep the other hand behind your back.
- DO NOT carry any metal objects such as a mechanical pencil or a measuring tape that could fall and cause a short circuit.
- After removing ring-terminal style high voltage wires, protect and insulate the terminal ends immediately with the **EL-50209** high voltage terminal cover and ULÂ® Listed or equivalent insulation tape rated at a minimum of 600 V.
- Always tighten the high voltage terminal fasteners to the specified torque. Insufficient or excessive torque will cause malfunctions or damage.
- After finishing work on the high voltage systems and before reinstalling the high voltage manual disconnect, inspect for the following:
  - Verify high voltage system integrity and that all connectors are installed.
  - Verify that all tools or loose components have been removed.

Labels for Components, Wire Harness, and Connectors

The wire harnesses and cables for high voltage circuits are encased in an orange colored covering. In addition, high voltage components such as the Energy Storage System and high voltage cables are affixed with "High Voltage" red danger and orange warning labels.

High Voltage Insulation Glove Inspection Procedure

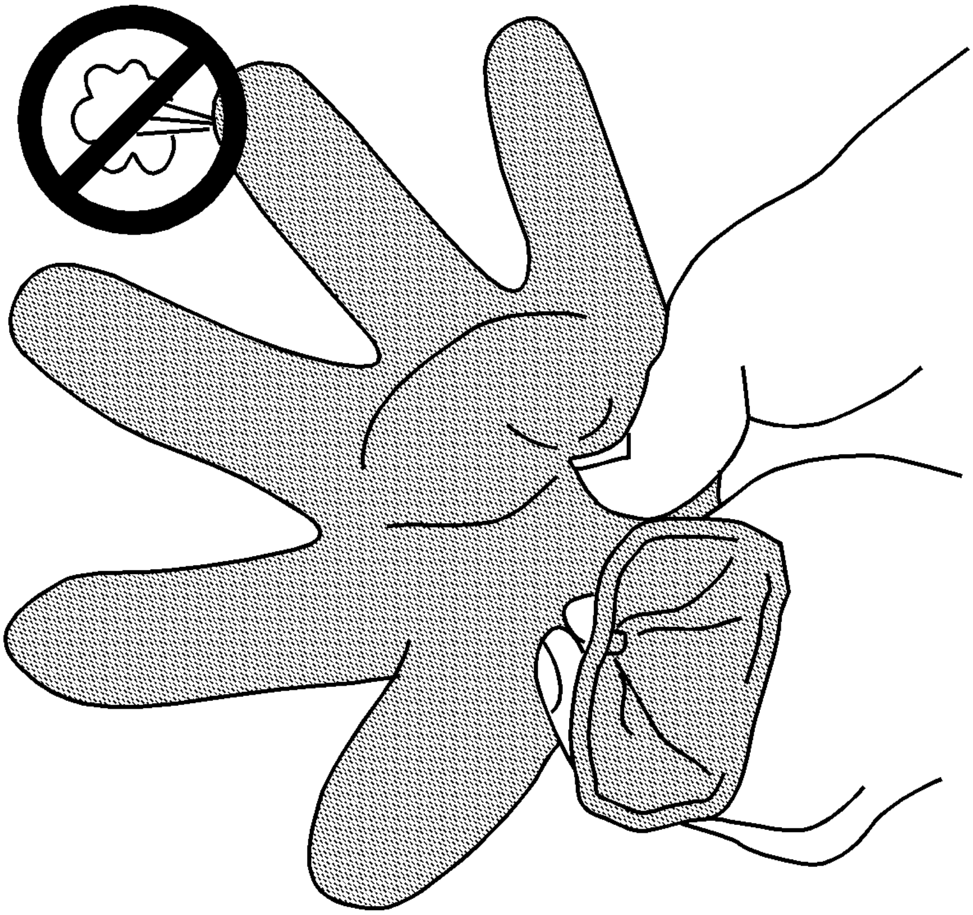

Fig. 1: Glove Inspection Procedure
Courtesy of GENERAL MOTORS COMPANY

The following procedure visually and functionally inspects the insulation gloves to be used while performing service on high voltage systems. This inspection procedure should be performed prior to any procedure that requires the use of class "0" insulation gloves rated at 1000 V.

1. Remove glove from leather protector.
2. Trap air in the glove and seal opening. Pinch or roll the opening closed tightly to prevent any air loss.
3. Press glove to increase pressure.
4. Inspect for the following conditions:
    - Pin holes
    - Air leaks
    - Wear, tears, or abrasions
    - Damp or wet material
    - Expired certification
    - **If any of the above conditions are met**

      Do not use the gloves.

    - **If none of the above conditions are met**
5. All OK. Gloves are OK to use.

HIGH VOLTAGE DISABLING

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure utilizes two possible methods to disable high voltage:

NOTE: **The High Voltage Disable procedure, regardless of the method, only de-energizes the high voltage circuits and components outside of the Hybrid/EV battery pack, dangerous voltage levels always exist within the Hybrid/EV battery pack.**

1. Scan Tool Method: The on-vehicle control module software, initiated by the GDS2 scan tool, disables and discharges high voltage outside of the Hybrid/EV battery pack.
2. DMM Method: If the GDS2 Scan Tool Method does not complete or cannot be implemented, A DMM-based physical measurement method is performed at certain high voltage connectors.

A successful GDS2 Scan Tool High Voltage Disable Procedure will:

1. Perform an analysis of the vehicle condition by verifying specific DTCs have run and passed.
2. Calculate the high voltage isolation resistance to the vehicle chassis.
3. Open the high voltage contactor relays and discharge the high voltage system by setting a crash event lockout. When this stage is reached the **Clear Secured High Voltage DTCs** procedure will have to be performed to enable the system again.
4. Latch a Service Lockout condition to prevent unintended enabling of the high voltage system.
5. Instruct you when to remove the manual service disconnect.
6. Indicate successful high voltage disabling by:
    - Displaying a PROCEDURE COMPLETE message on the scan tool
    - Displaying a CHECK VEHICLE'S HIGH VOLTAGE STATUS message on the scan tool which will require you to verify:
        1. Vehicle is displaying an Instrument Cluster DIC message.
        2. Vehicle is sounding a continuous audible response from the vehicle Pedestrian Alert alarm.
        3. High Voltage Inverter Voltage parameter on scan tool indicates system high voltage has been lowered to a safe level.

An Unsuccessful GDS2 Scan Tool High Voltage Disable Procedure:

If vehicle conditions DO NOT permit the GDS2 scan tool procedure to complete, you will have to verify high voltage disabling by measuring the applicable connectors for safe voltage level with a DMM.

Diagnostic Aids

Review the **High Voltage Connectors** information for connector identification and the approved procedures for disconnecting and connecting high voltage connectors.

Circuit/System Testing

WARNING: **Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.**

WARNING: **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:**

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Review the high voltage safety information. Refer to **High Voltage Safety**.

NOTE: **Ensure the 12V battery is fully charged and tested prior to continuing.**

2. Disconnect and remove all 12 V Battery Chargers and the Charge Cable from the X98 Hybrid Battery Charger Receptacle.

NOTE: **If vehicle conditions do not allow for GDS2 scan tool usage, proceed to GDS2 Scan Tool Procedure Unsuccessful below.**

3. Access the GDS2 scan tool High Voltage Disable Procedure located under HPCM2 Control Functions.
4. Perform the actions as specified within the GDS2 scan tool procedure.

NOTE: **If at any point the GDS2 scan tool displays a "PROCEDURE UNSUCCESSFUL" warning message or you lose communication, stop the GDS2 procedure and proceed to GDS2 Scan Tool Procedure Unsuccessful below.**

5. WHEN INSTRUCTED by the GDS2 procedure, remove the S15 Manual Service Disconnect. Refer to **Drive Motor Battery High Voltage Manual Disconnect Lever Replacement** . Place the S15 Manual Service Disconnect in a secure place outside the vehicle. Cover the exposed high voltage opening with UL listed, or equivalent, insulation tape rated at a minimum of 600 V.
6. Verify the GDS2 scan tool procedure completed successfully by observing a GDS2 scan tool "PROCEDURE COMPLETE" message followed by a "CHECK VEHICLE'S HIGH VOLTAGE STATUS" message. Verify these messages are combined with ALL the following conditions:
   - A Continuous Audible Vehicle Response of the Pedestrian Alert alarm
   - DIC message
   - High Voltage Inverter Voltage parameter on scan tool indicates system high voltage is less than 10 volts
   - **If the procedure was unsuccessful**

     Proceed to GDS2 Scan Tool Procedure Unsuccessful below.

   - **If the procedure successfully completed**

   1. Turn the vehicle power mode to OFF.

   NOTE: **Disconnecting the 12 V battery is the only method to deactivate the audible**

vehicle response. If the 12 V battery is reconnected while the S15 Manual Service Disconnect is removed, the audible vehicle response will continue for several minutes.

2. Disconnect the 12 V battery. Refer to Battery Negative Cable Disconnection and Connection .

NOTE: **You will have to perform the Clear Secured High Voltage DTCs GDS2 scan tool procedure in order to re-enable the high voltage system upon completion of the required vehicle servicing.**

3. The high voltage circuits and components OUTSIDE of the Hybrid/EV battery pack are now disabled/discharged.

NOTE: **Print the High Voltage Disable Confirmation table if necessary. Circle Steps Completed to identify which components have been disabled.**

High Voltage Disable Confirmation Table

Was the GDS2 Scan Tool Procedure SUCCESSFUL?	**Circle One:**	**NO**	**YES**
	If YES, all high voltage external of the A4 Hybrid/EV Battery Pack is now disabled. Fill-out and Print form as necessary. **If NO, perform GDS2 Scan Tool Procedure Unsuccessful steps as required**		
Confirm GDS2 Scan Tool Procedure Unsuccessful Steps Completed Below			
High Voltage Components you wish to Disable	**GDS2 Scan Tool Procedure Unsuccessful Steps that must be completed**	**Steps Completed**

GDS2 Scan Tool Procedure Unsuccessful

NOTE: **If the GDS2 Scan Tool Procedure was unsuccessful, follow the steps below as applicable.**

1. Remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Attempt to start the vehicle with the Ignition Mode Switch.
    - **If the vehicle enters Propulsion System Active mode or the engine starts**

Locate and remove all keyless entry transmitters from within the vehicle and return to the beginning of the GDS2 Scan Tool Procedure Unsuccessful procedure.

- **If the vehicle did not enter Propulsion System Active mode and the engine did not start**

NOTE: **The 12 V battery must be disconnected to ensure proper test results.**

NOTE: **You must ensure Battery Maintenance Mode is not active before disconnecting the 12V battery.**

3. Disconnect the 12 V battery. Refer to **Battery Negative Cable Disconnection and Connection** .
4. Remove the S15 Manual Service Disconnect. Refer to **Drive Motor Battery High Voltage Manual Disconnect Lever Replacement** . Place the S15 Manual Service Disconnect in a secure place outside the vehicle. Cover the exposed high voltage opening with ULÂ® listed, or equivalent, insulation tape rated at a minimum of 600 V.

NOTE: **5 min must elapse before removing any high voltage connectors. Removal of non high voltage components is allowed during this wait time.**

5. Wait 5 min before continuing, to allow the high voltage capacitors to discharge.

NOTE: **A 9 V DC battery or the vehicles 12 V battery can be used to test the DMM.**

6. Verify the test DMM by measuring a known good 9 to 12 V battery.
   - **If the DMM does not properly measure the test battery**

     Repair or replace the DMM and repeat all voltage measurements.

   - **If the DMM properly measures the test battery**

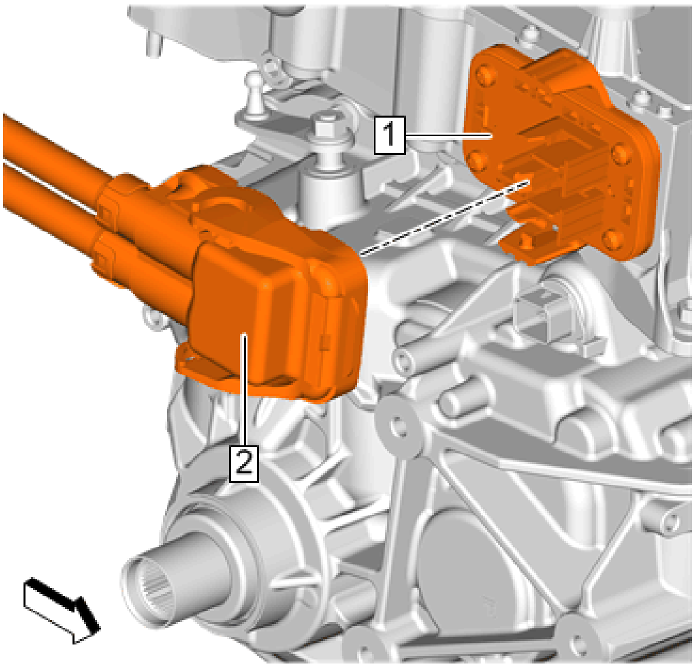

Fig. 2: T6 Power Inverter Module Connector And T24 Battery Charger - DC High Voltage Harness Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE:
- **Wear your High Voltage Insulation gloves until you have determined that a high voltage exposure risk is no longer present.**
- **Inspect the High Voltage DC connection seal for deformation or damage. Inspect the High Voltage DC connector for seal residue or debris. Always replace damaged seals and clean seal remnants from the connector with a non-marring tool.**

7. Disconnect the T24 Battery Charger - DC high voltage harness connector (2) at the T6 Power Inverter Module.

NOTE: **5 min must have elapsed since removing the S15 Manual Service Disconnect before continuing to allow the high voltage capacitors to discharge and ensure**

proper test results.

8. Verify the voltage measures less than 3 V at the T6 Power Inverter Module connector (1) at the following points:
    - High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
    - **If 3 V or greater**

      Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

    - **If less than 3 V**
9. Verify the voltage measures less than 3 V at the HV DC harness connector (2) to the T6 Power Inverter Module at the following points:
    - High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
    - **If 3 V or greater**

      There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack. Refer to **Hybrid/EV Battery Voltage Present**.

    - **If less than 3 V**
10. Raise the vehicle and remove the underbody forward air deflector.

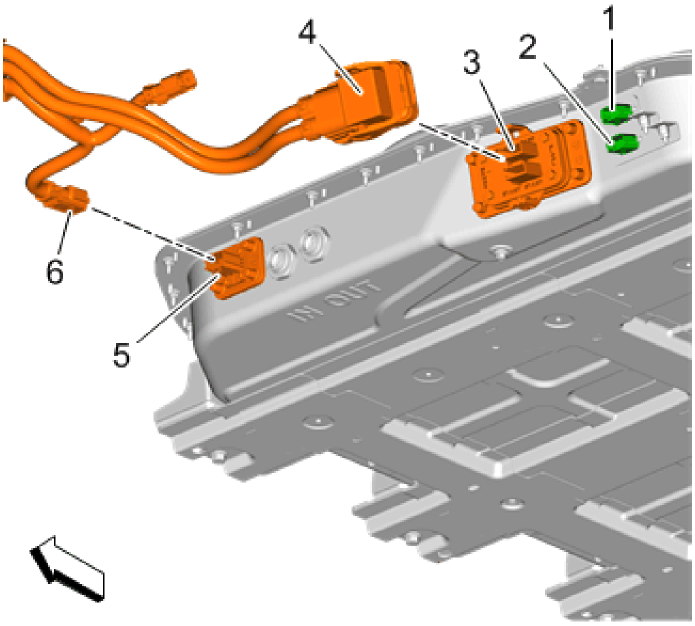

Fig. 3: A4 Hybrid/EV Battery Pack Connectors, T18/T24 Battery Charger Harness Connectors And Low Voltage Harness Connectors
Courtesy of GENERAL MOTORS COMPANY

11. Disconnect the low voltage harness connectors (1, 2) at the A4 Hybrid/EV Battery Pack.
12. Disconnect the T18 Battery Charger harness connector (6) at the A4 Hybrid/EV Battery Pack.
13. Verify the voltage measures less than 3 V at the A4 Hybrid/EV Battery Pack connector (5) at the following points:
    - High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
    - **If 3 V or greater**

      There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack. Refer to **Hybrid/EV Battery Voltage Present**.

    - **If less than 3 V**
14. Verify the voltage measures less than 3V at the T18 Battery Charger harness connector (6) at the following points:

  - High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
  - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
  - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
  - **If 3 V or greater**

    Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

  - **If less than 3 V**

15. Disconnect the T24 Battery Charger - DC connector (4) at the A4 Hybrid/EV Battery Pack.
16. Verify the voltage measures less than 3 V at the T24 Battery Charger - DC harness connector (4) at the following points:
    - High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
    - **If 3 V or greater**

      Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

    - **If less than 3 V**
17. Verify the voltage measures less than 3 V at the A4 Hybrid/EV Battery Pack connector (3) at the following points:
    - High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
    - **If 3 V or greater**

      There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack. Refer to **Hybrid/EV Battery Voltage Present**.

    - **If less than 3 V**

NOTE: **Discard any 300 V Battery Positive and Negative cable connector seal that may be deformed or damaged. Replace any seal that is deformed, missing, or damaged.**

NOTE: **A 9 V DC battery or the vehicles 12 V battery can be used to test the DMM.**

18. Verify the test DMM by measuring a known good 9 to 12 V battery.
    - **If the DMM does not properly measure the test battery**

      Repair or replace the DMM and repeat all voltage measurements.

    - **If the DMM properly measures the test battery**
19. The high voltage connectors at the A4 Hybrid/EV battery pack are now discharged. You may perform A4 Hybrid/EV battery pack removal and exit the High Voltage Disabling procedure at this time but you MUST continue if additional high voltage component service is required.
    - **If you do not need to perform additional high voltage component service**

      HV Disable for T6 power inverter module, T12 Transmission and A4 Hybrid battery pack is complete.

    - **If you need to perform additional high voltage component service**
20. Disconnect the high voltage connector(s) at the component(s) to be serviced.
21. Verify the voltage measures less than 3 V at the Module-side connector at the following points:
    - High voltage DC (-360 V) negative terminal B to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A to vehicle chassis ground.
    - High voltage DC (+360 V) positive terminal A and high voltage DC (-360 V) negative terminal B.
    - **If 3 V or greater**

      Leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.

- **If less than 3 V**

22. Repeat the previous step at all high voltage module connectors for any additional high voltage components requiring service.
23. Verify the test DMM by measuring a known good 9 to 12 V battery.
    - **If the DMM does not properly measure the test battery**

      Repair or replace the DMM and repeat all voltage measurements.

    - **If the DMM properly measures the test battery**
24. High voltage is disabled/discharged at all TESTED modules.

HIGH VOLTAGE ENABLING

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The High Voltage Enabling procedure will perform the following tasks:

- Identify how to enable high voltage.
- Verify high voltage system integrity and that all connectors are installed.

Diagnostic Aids

Review the **High Voltage Connectors** information for connector identification and the approved procedures for disconnecting and connecting high voltage connectors.

Circuit/System Testing

WARNING: **Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.**

WARNING: **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:**

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Review the high voltage safety information prior to performing the High Voltage Enabling procedure. Refer to High Voltage Safety
2. Ensure that the 12 V battery is disconnected. Refer to Battery Negative Cable Disconnection and Connection

NOTE:

- **Always tighten the high voltage fasteners to the specified torque. Insufficient or excessive torque will cause malfunctions or damage.**
- **The high voltage connectors that have been disconnected do not require a specific sequence when connecting.**

3. After finishing work on the high voltage systems and before installing the S15 Manual Service Disconnect, inspect for the following:
   - Verify that all tools or loose components have been removed.
   - Inspect any disconnected 300 V Battery Positive and Negative cable seals for being deformed, missing, or damaged. Replace any seals that are deformed, missing, or damaged.
   - Verify high voltage system integrity and that all connectors are installed.
   - Verify that all high voltage interlock circuit connectors and covers are installed.
   - Install any components or connectors that have been removed or replaced during diagnosis.
4. Install the S15 Manual Service Disconnect (1). Refer to Drive Motor Battery High Voltage Manual Disconnect Lever Replacement
5. Connect the 12 V battery. Refer to Battery Negative Cable Disconnection and Connection .
6. Vehicle in Service Mode.
7. Verify if the A4 Hybrid/EV Battery Pack or the K16 Battery Energy Control Module has been replaced.
   - **If the A4 Hybrid/EV Battery Pack or the K16 Battery Energy Control Module has been replaced**

     Program the K16 Battery Energy Control Module. Refer to Battery Energy Control Module Programming and Setup . Continue to the next step once programming is complete.

   - **If the A4 Hybrid/EV Battery Pack or the K16 Battery Energy Control Module has not been replaced**
8. Verify if the High Voltage Disabling procedure performed prior to vehicle repair utilized the GDS2 scan tool method.
   - **If the GDS2 scan tool high voltage disabling procedure was performed, the high voltage contactor relays are in a lockout state.**

     Perform the Clear Secured High Voltage DTCs procedure and return to the next step.

   - **If the DMM Method high voltage disabling procedure was performed**
9. Vehicle in Service Mode, perform the driver window express learn and clear all DTC Information with a scan tool. Refer to Window Motor Programming - Express Function .
10. Vehicle OFF and all vehicle systems OFF. It may take up to 5 min for all vehicle systems to power down.
11. Vehicle in Service Mode.
12. Verify with a scan tool no DTCs are set.
    - **If any DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If no DTCs are set**
13. Vehicle ON.
14. Vehicle OFF and wait 5 min.
15. Vehicle in Service Mode. Verify with the scan tool the Hybrid/EV Powertrain Control Module and K114B Hybrid/EV Powertrain Control Module 2 DTC Information that the following DTCs have Ran Since Code Clear and have not set:

- Motor position sensor learn DTC P0C17.
- Contactor DTCs P0AD9, P0ADD, P0D0A, and P1EBD.
- Discharge and Pre-charge DTCs P0C76, P0C78, P0AFB, and P3061.
- High voltage loss of isolation DTCs P0AA6, P1AE6, and P1AF0.
- **If any DTCs are set**

  Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If the DTCs have Not Ran Since Code Clear**

1. Review and operate the vehicle according to the applicable DTC Conditions for Running and ensure the DTCs run and pass.
2. Verify with the scan tool the Hybrid/EV Powertrain Control Module and K114B Hybrid/EV Powertrain Control Module 2 DTC Information that the specified DTCs have Ran Since Code Clear and have not set:
   - If any DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
   - If the DTCs have Ran and Passed
3. Test drive the vehicle and verify no DTCs are set.

- **If the DTCs have Ran and Passed**

16. Test drive the vehicle and verify no DTCs are set.

WARNING: **Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.**

Review the high voltage safety information. Refer to High Voltage Safety.

HVA280 1 Click Connector Procedure

HVA280 1 click Disconnect Procedure

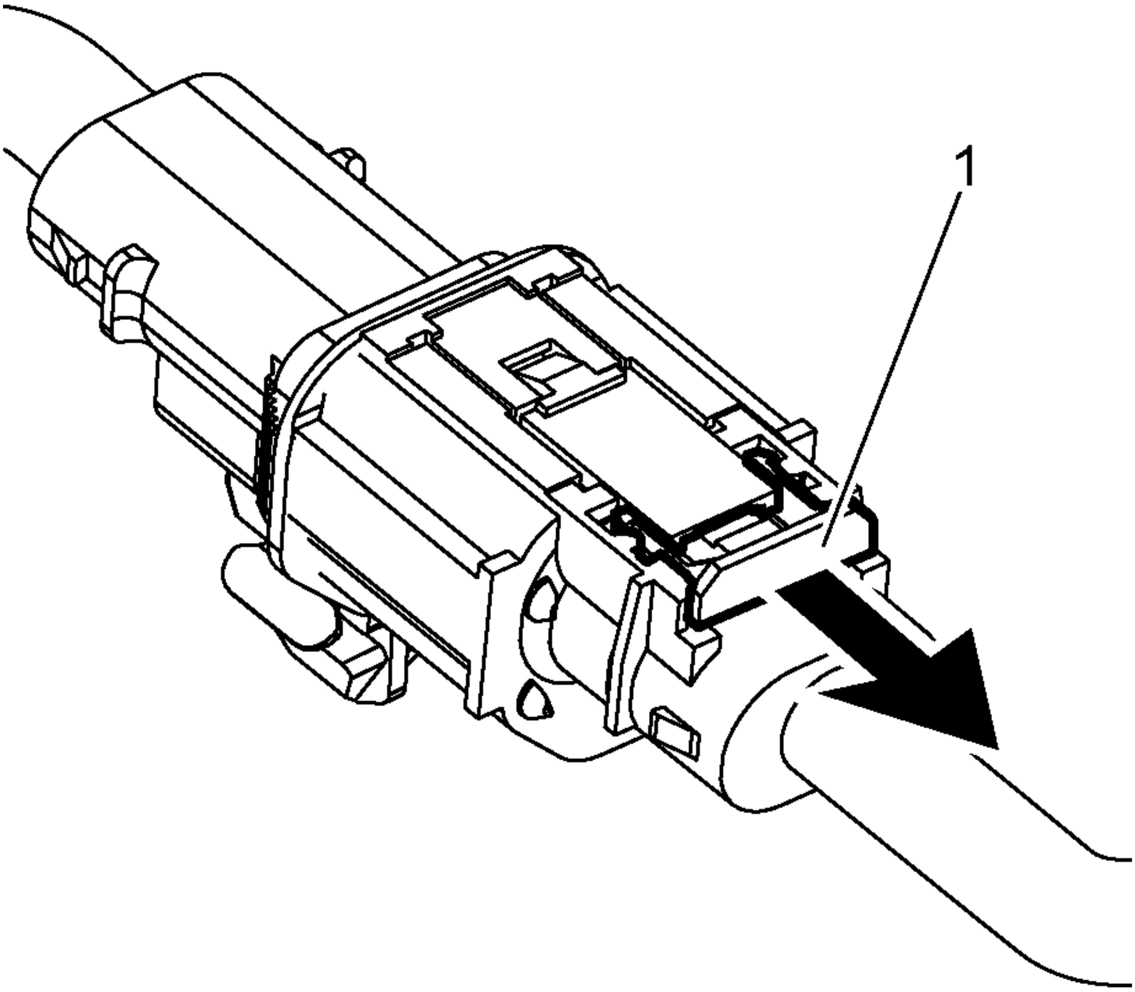

Fig. 5: Connector Position Assurance (CPA) Tab
Courtesy of GENERAL MOTORS COMPANY

1. Pull the connector position assurance (CPA) tab (1) back from the locked position to the pre-stage position. There will be an audible click sound when the CPA tab is in the correct position.

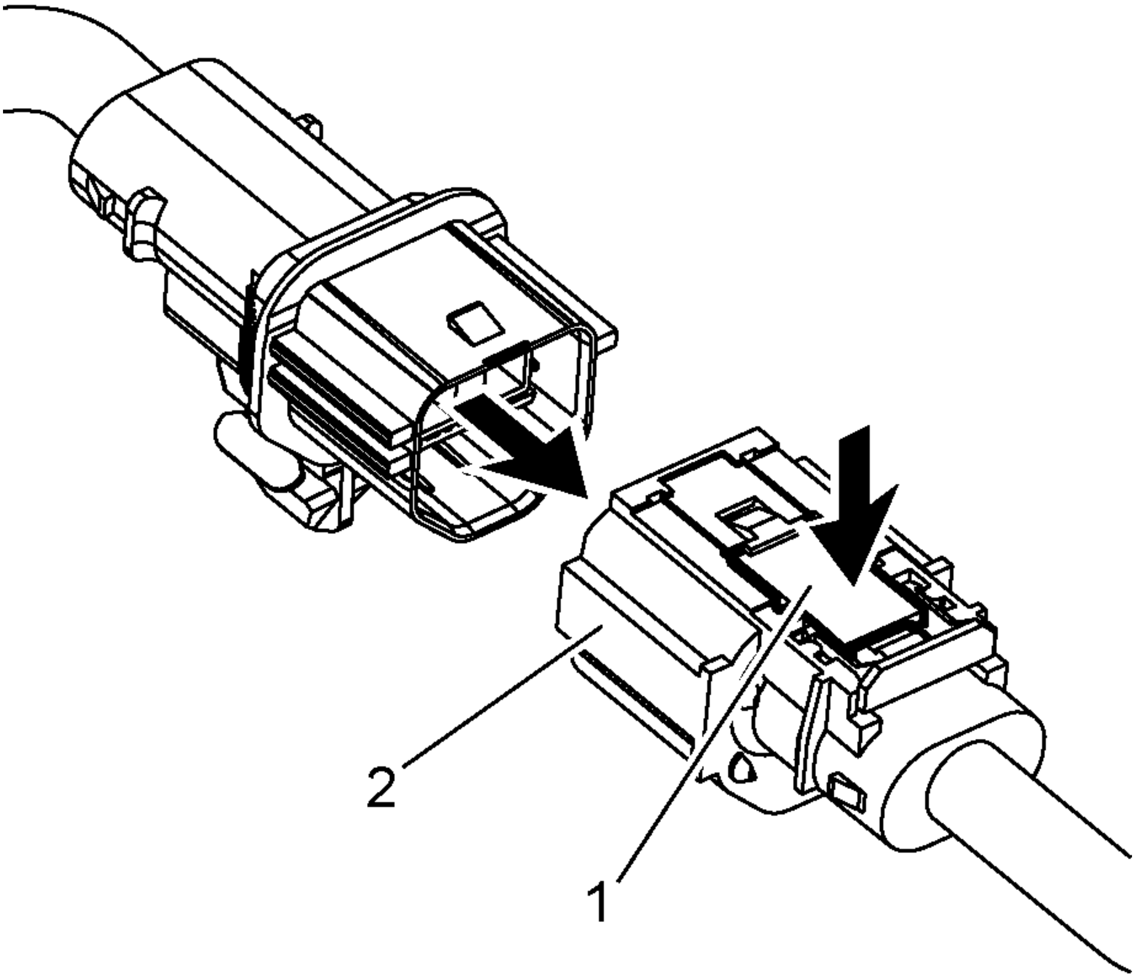

Fig. 6: Primary Lock Feature And Female Connector
Courtesy of GENERAL MOTORS COMPANY

2. Depress the primary lock feature (1) to release the lock and pull back on the female connector (2) to disconnect the connector completely.

HVA280 1 click Connect Procedure

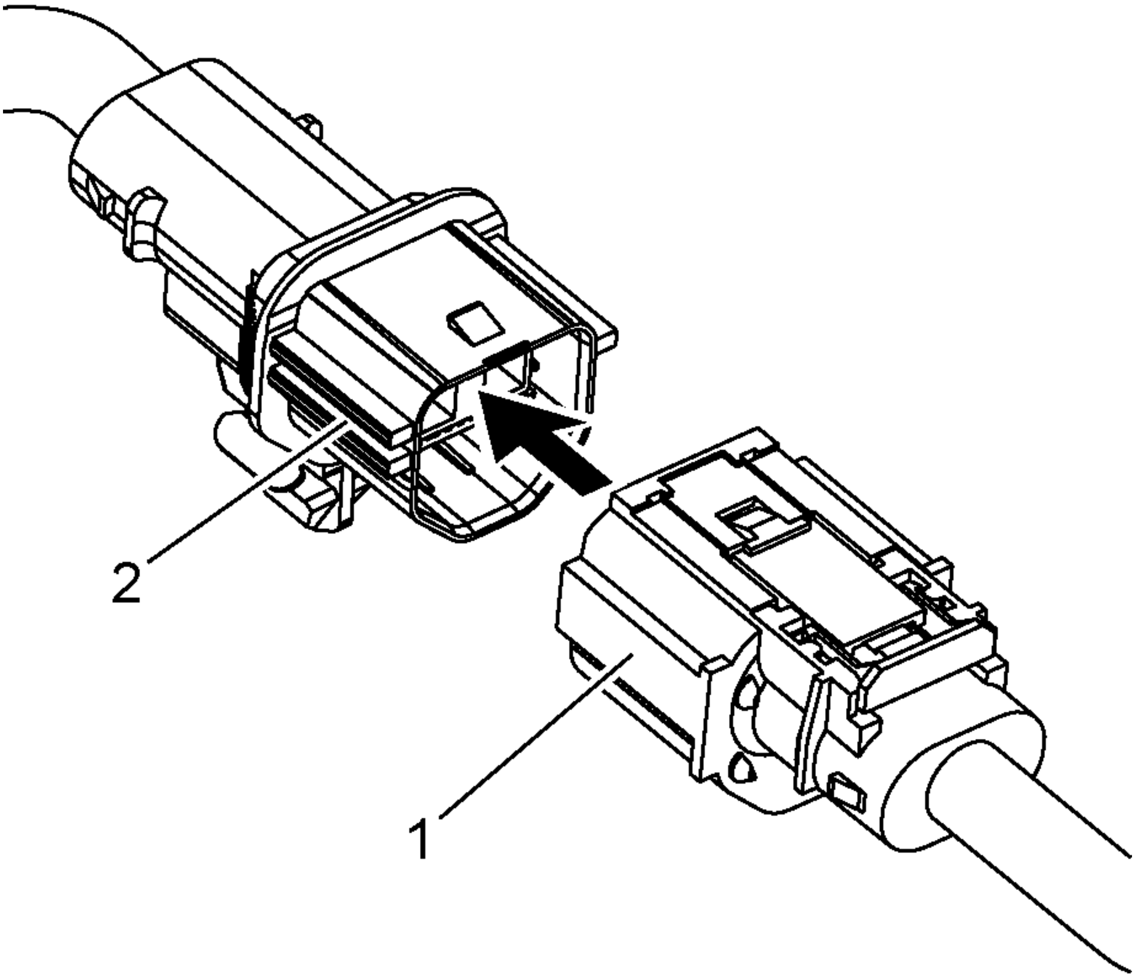

Fig. 7: Index Features
Courtesy of GENERAL MOTORS COMPANY

1. Align the connector with the index features (2) and install the connector by pushing on the sides of the connector (1). There will be an audible click sound when the connector lock is secured.

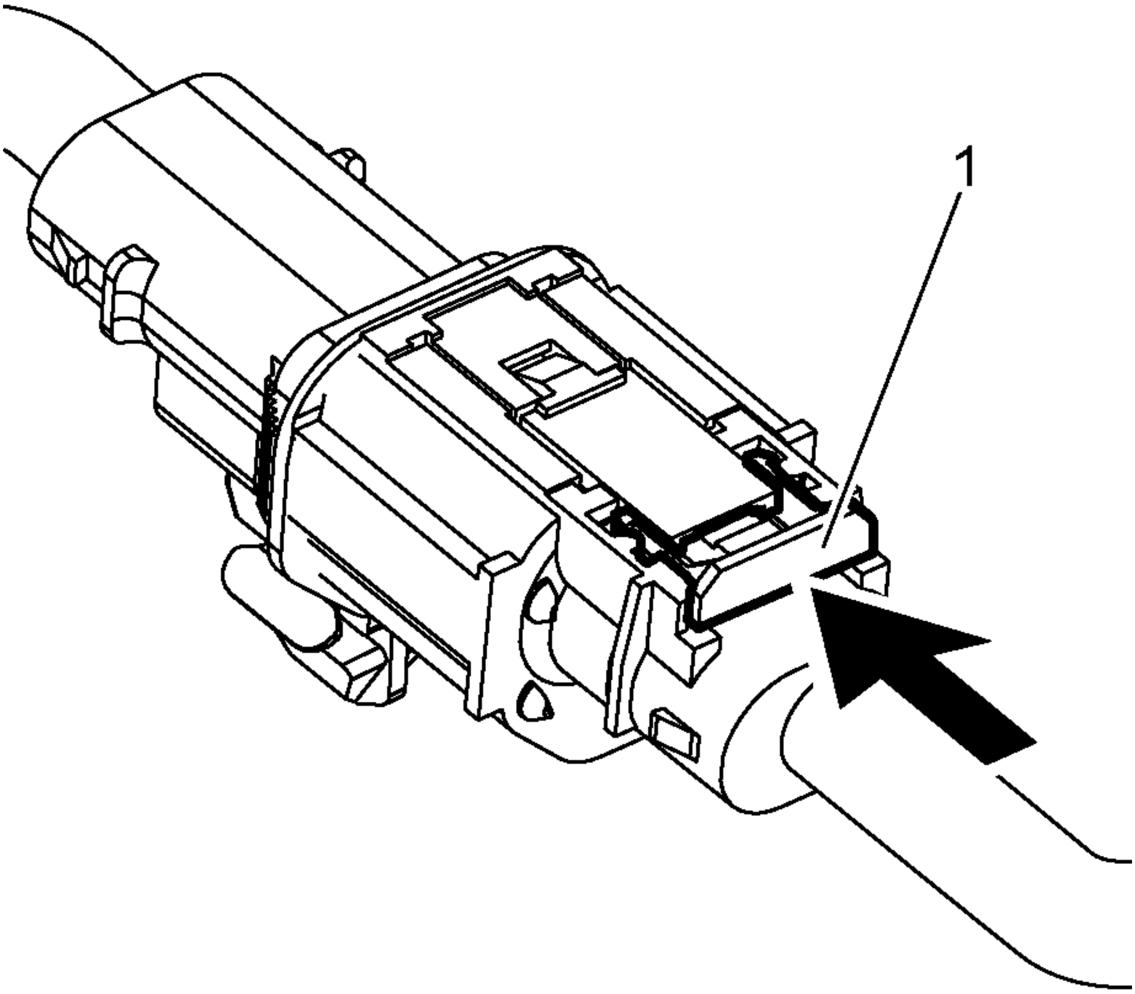

Fig. 8: CPA Tab
Courtesy of GENERAL MOTORS COMPANY

2. Push the CPA tab (1) to lock the connector in the full-stage position. There will be an audible click sound when the CPA tab is secured.

HV280 Connector Procedure

HV280 Disconnect Procedure

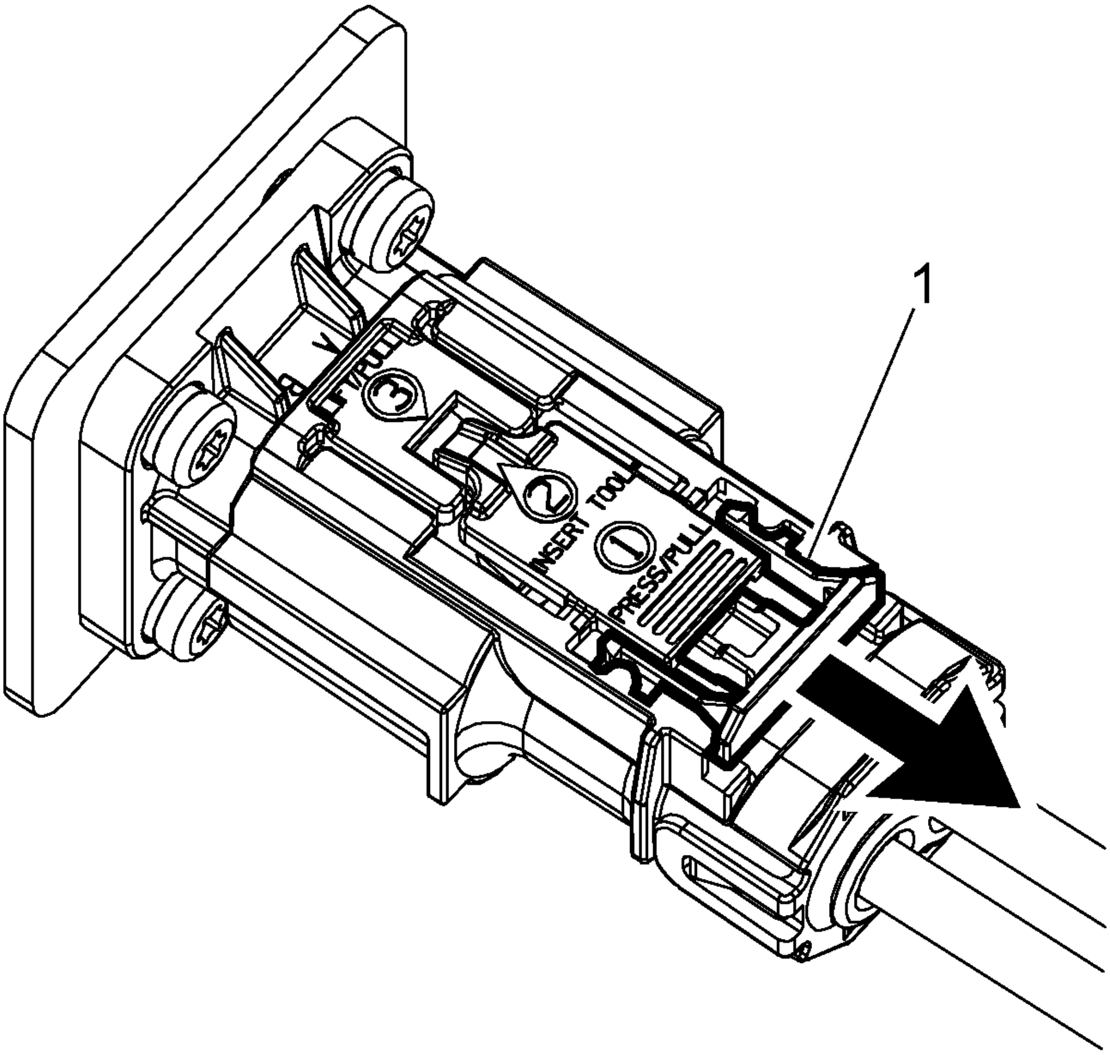

Fig. 9: Connector Position Assurance (CPA) Tab
Courtesy of GENERAL MOTORS COMPANY

1. Pull the connector position assurance (CPA) (1) tab back from the locked position to the pre-stage position. There will be an audible click sound when the CPA tab is in the correct position.

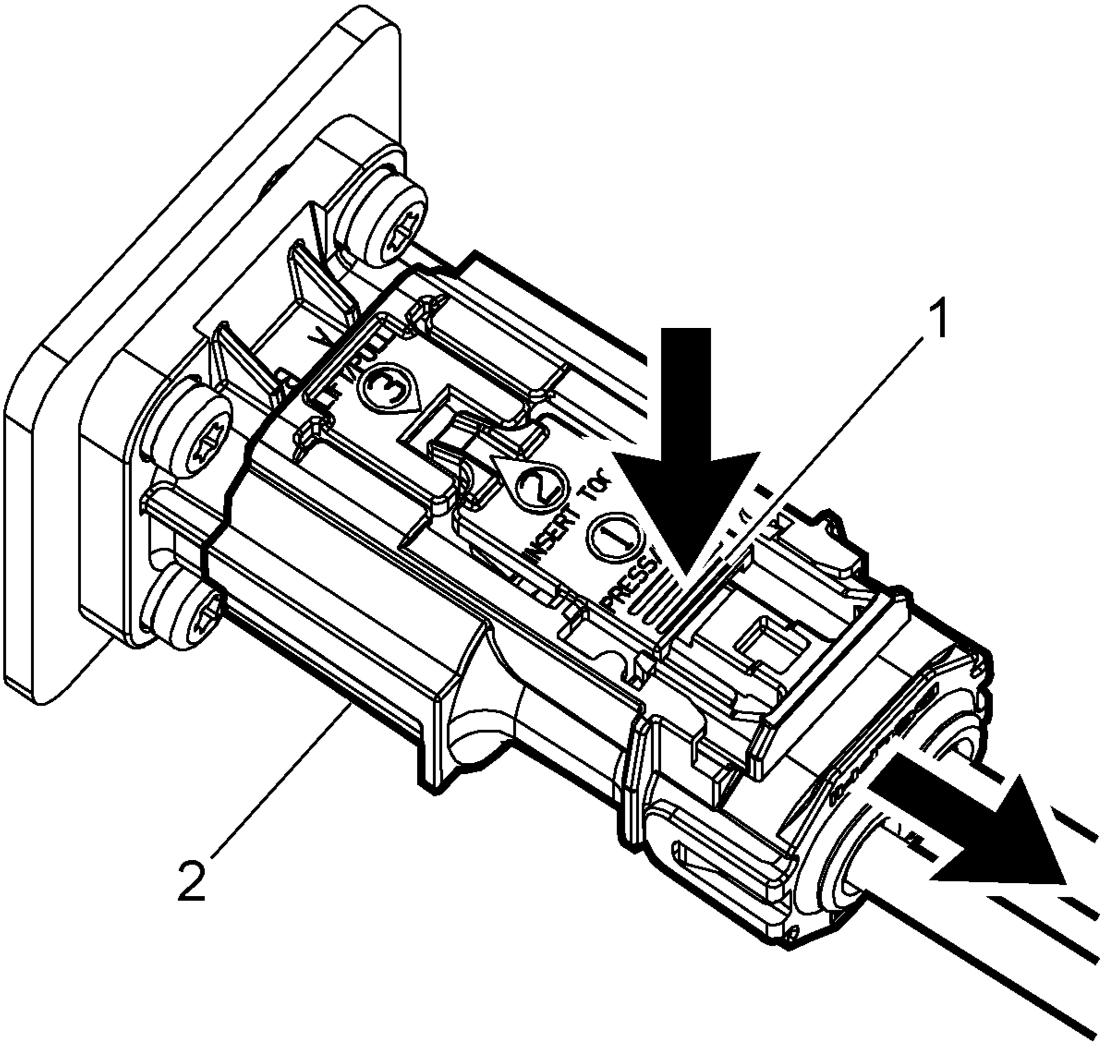

Fig. 10: Female Connector And Female Connector Lock
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Pull on the sides of the connectors only. The connector will stop in a partial-mate position when performing the next step.**

2. Press firmly on the back of the female connector lock (1) and hold down, while pulling the female connector (2) assembly halfway apart, until the connector is in the partial-mate position.

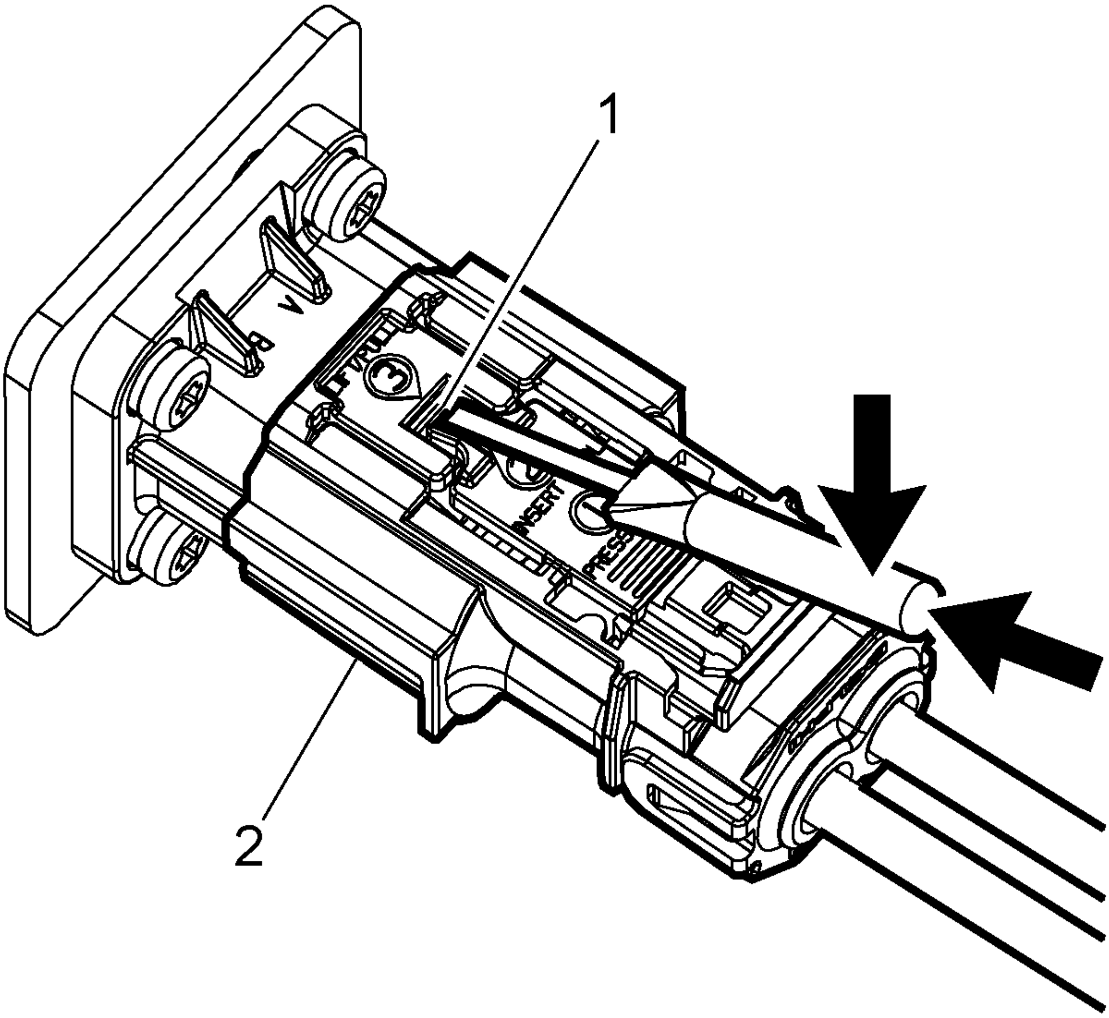

Fig. 11: Second Connector Lock And Female Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the connector does not separate easily when pulled after the second connector lock is released, check that both sides of the second connector lock have been released.**

3. Insert a suitable tool into the slot under the second connector lock (1). Using the tool as a lever, release the female connector by gently raising the second connector lock. An audible click or clicks will be heard on both sides of the connector as the second lock is released.
4. Remove the tool and pull the female connector (2) to fully disconnect.

HV280 Connect Procedure

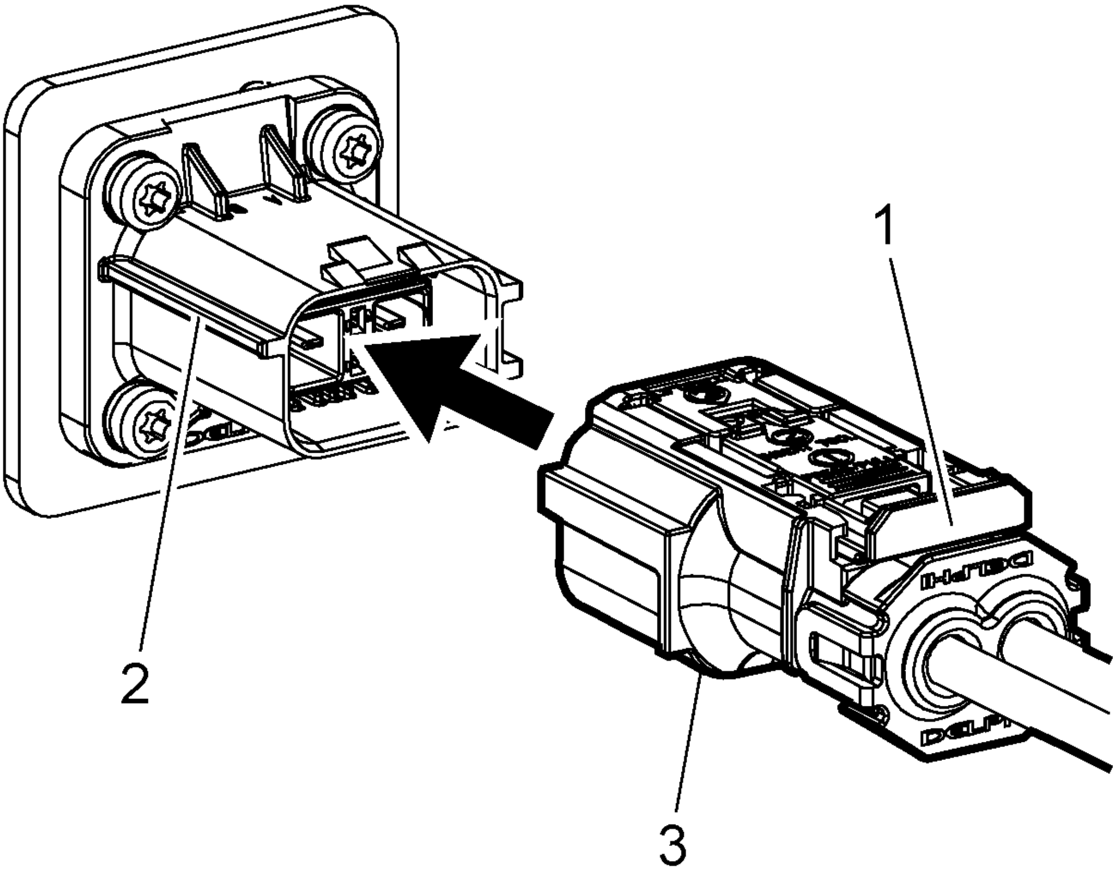

Fig. 12: Connector Position Assurance (CPA) Tab, Index Guides And Connector
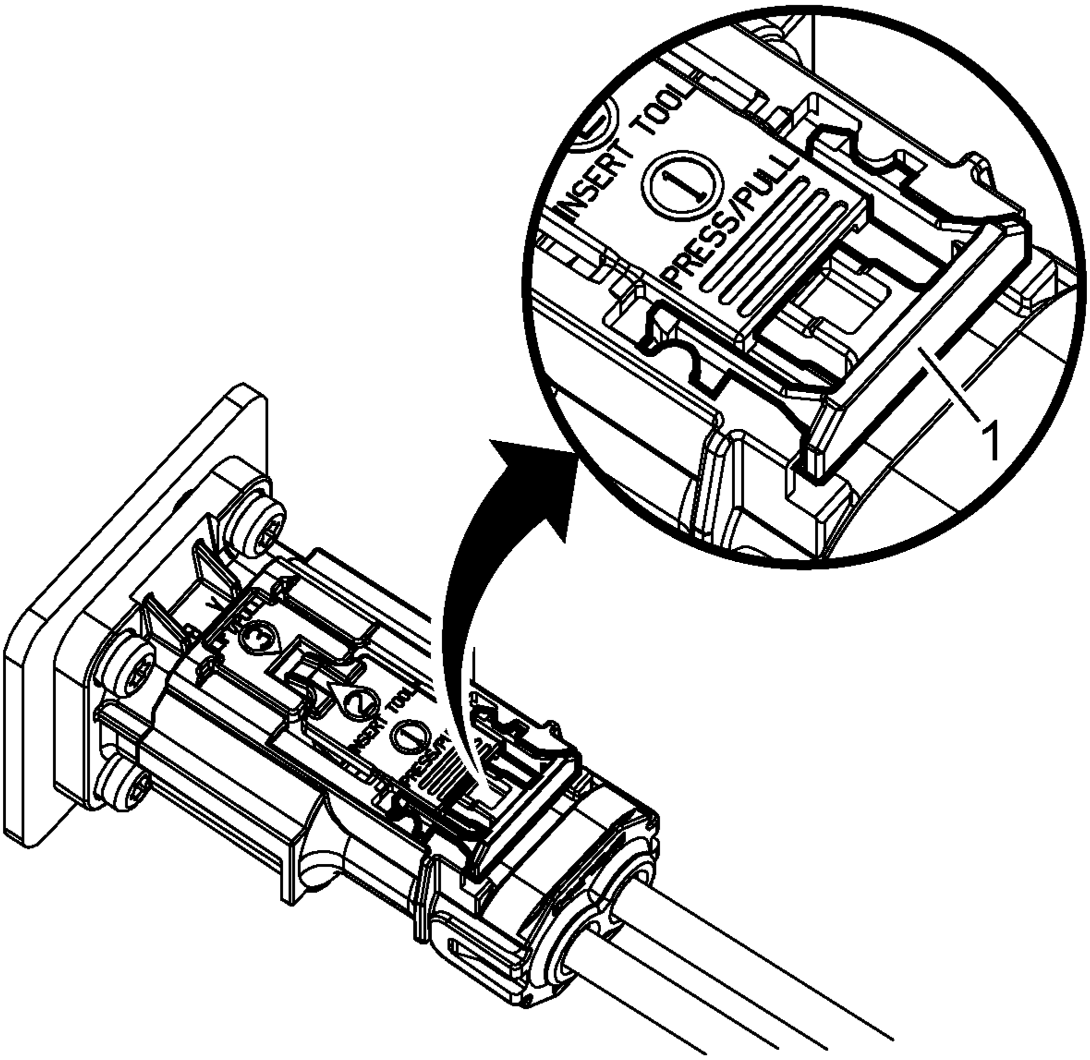
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- **Ensure the CPA tab (1) is in the pre-stage position.**
- **The connector will be fully mated when a series of 2 audible clicks is heard.**

1. Align the connector with the index features (2) and install the connector by pushing on the sides of the connector (3).



[Fig. 13: Connector Position Assurance (CPA) Tab](#)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **There will be an audible click sound when the CPA tab is placed in the locked position. The CPA tab and connector body touch when fully seated.**

2. Push the CPA tab (1) forward from the pre-stage position to the locked position.

AMP+HVA280 Connector Procedure

AMP+HVA280 Disconnect Procedure

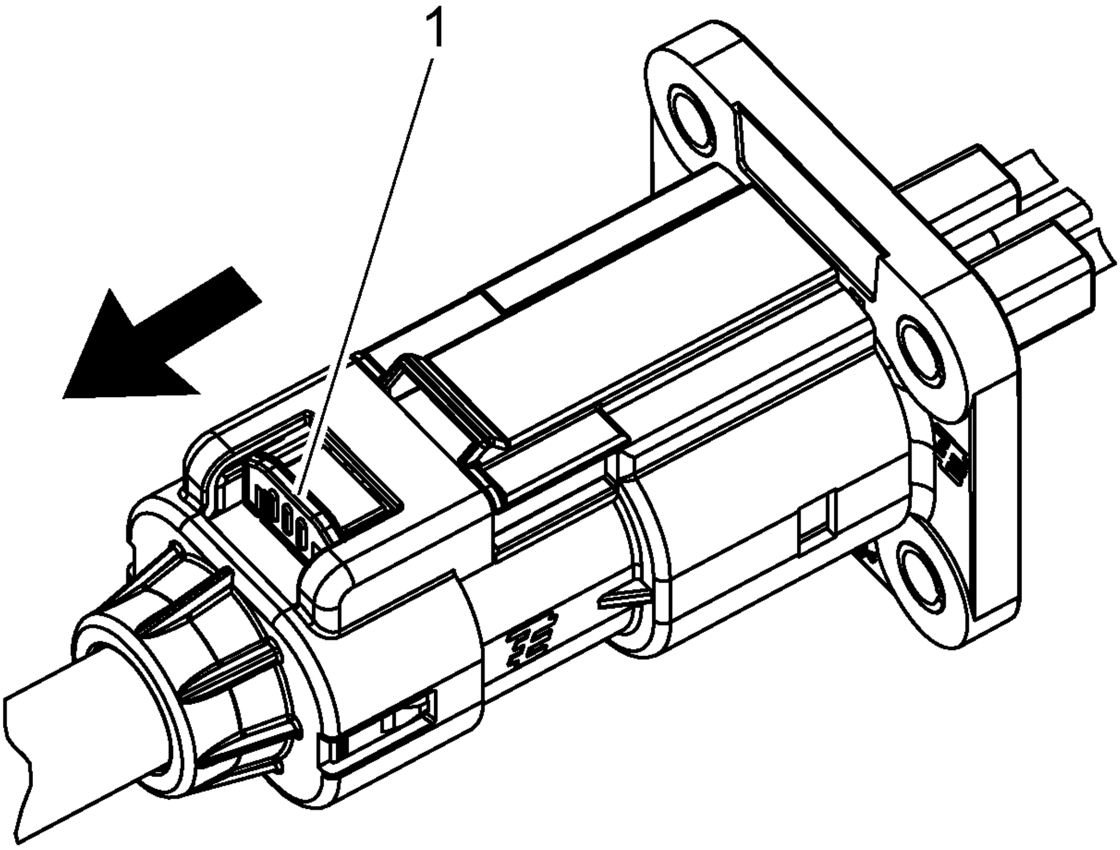


Fig. 14: Connector Position Assurance (CPA) Tab

1. Pull the connector position assurance (CPA) (1) tab back from the locked position to the pre-stage position. There will be an audible click sound when the CPA tab is in the correct position.

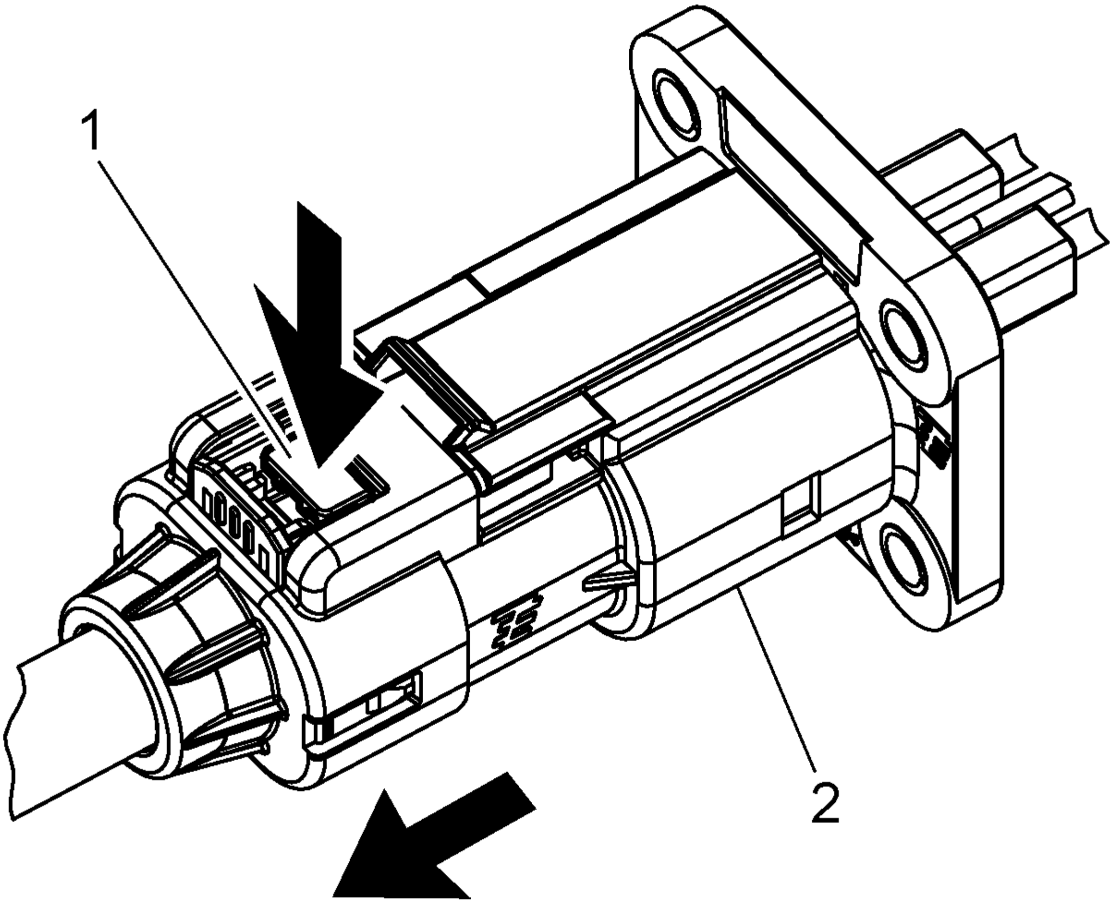

Fig. 15: Female Connector Lock And Female Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Pull on the sides of the connectors only. The connector will stop in a partial-mate position when performing the next step.**

2. Press firmly on the back of the female connector lock (1) and hold down, while pulling the female connector (2) assembly halfway apart, until the connector is in the partial-mate position.

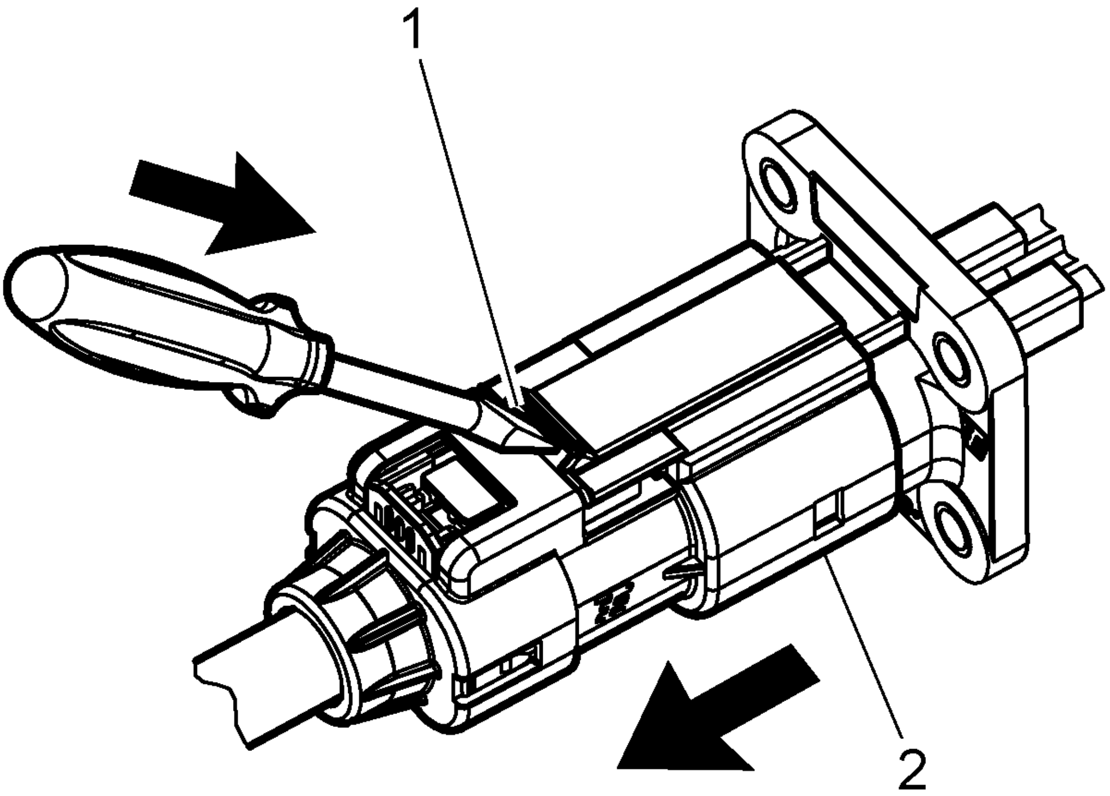

Fig. 16: Depressing Second Connector Lock To Disconnect Female Connector
Courtesy of GENERAL MOTORS COMPANY

3. Insert a suitable tool into the slot (1) and depress the second connector lock. An audible click will be heard as the second lock is released.
4. Remove the tool and pull the female connector (2) to fully disconnect.

AMP+HVA280 Connect Procedure

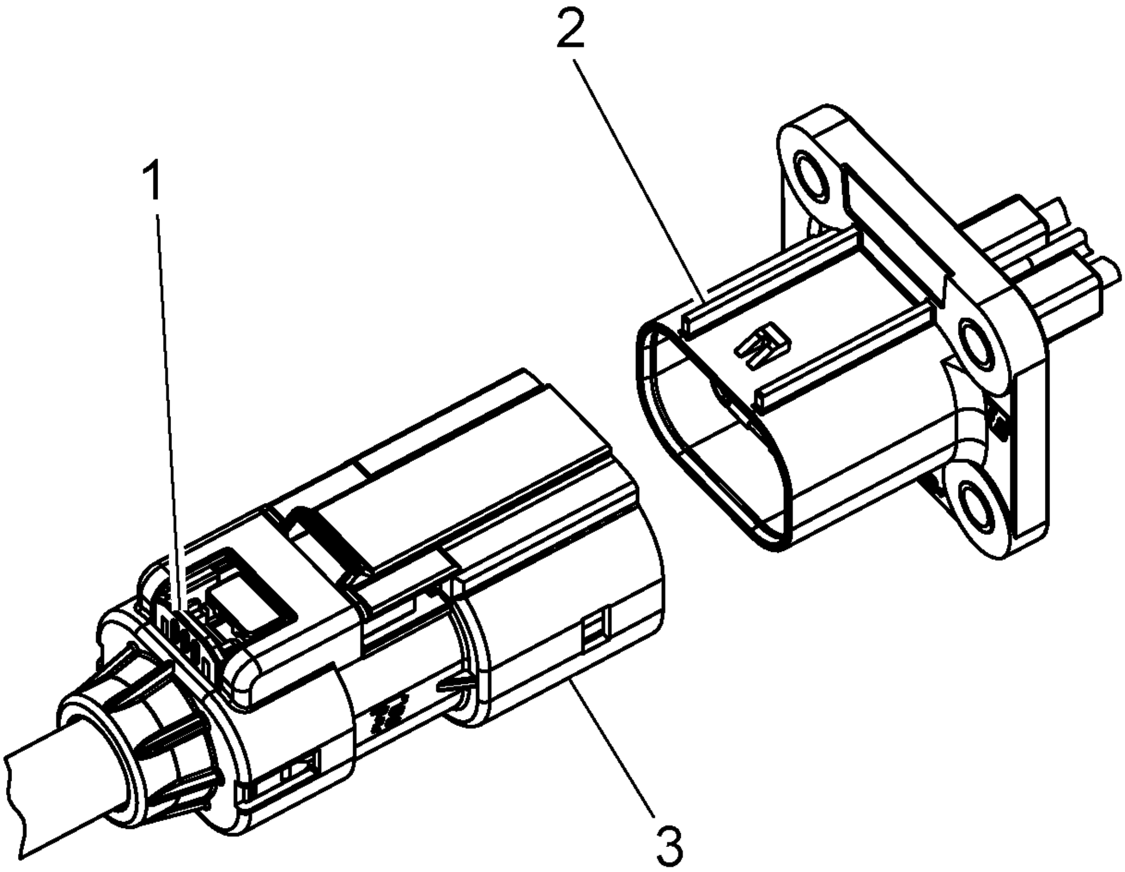

Fig. 17: Connector Position Assurance (CPA) Tab, Index Guides And Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- **Ensure the CPA tab (1) is in the pre-stage position.**
- **The connector will be fully mated when a series of two audible clicks is heard.**

1. Align the connector with the index features (2) and install the connector by pushing on the sides of the connector (3).

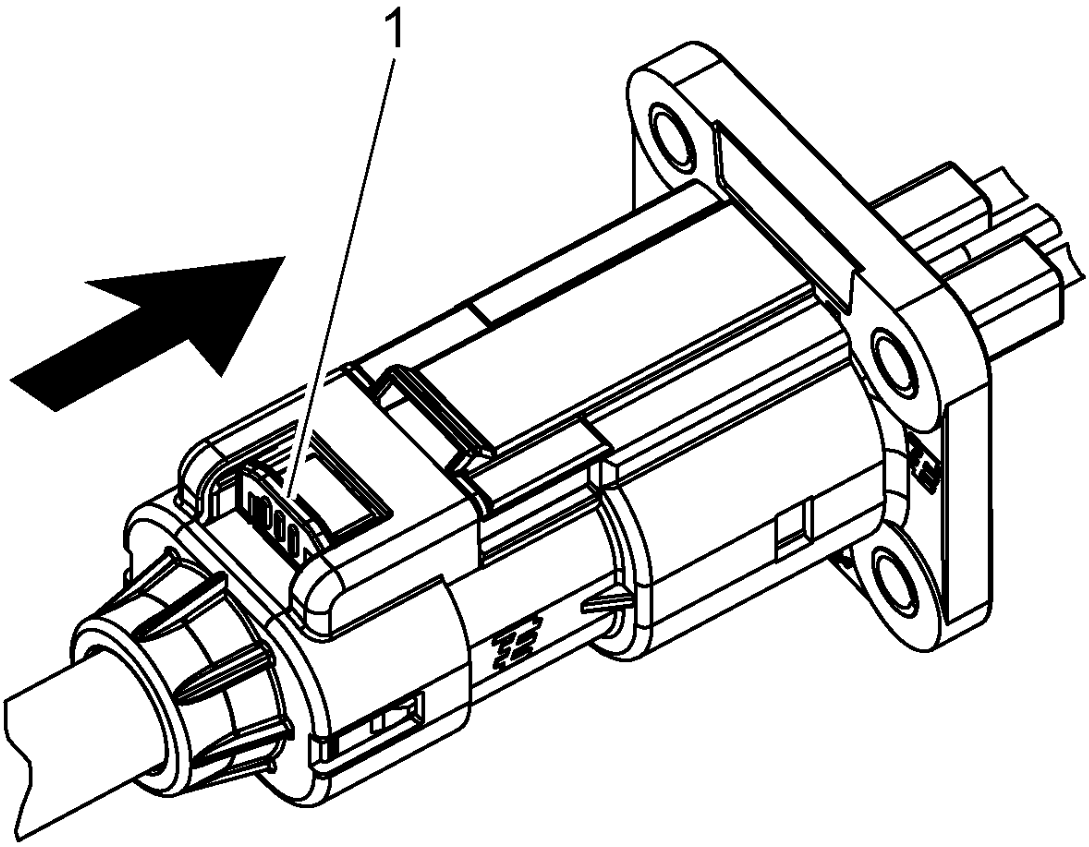

Fig. 18: Connector Position Assurance (CPA) Tab
Courtesy of GENERAL MOTORS COMPANY

NOTE: **There will be an audible click sound when the CPA tab is placed in the locked position. The CPA tab and connector body touch when fully seated.**

2. Push the CPA tab (1) forward from the pre-stage position to the locked position.

MP280 Connector Procedure

MP280 Disconnect Procedure

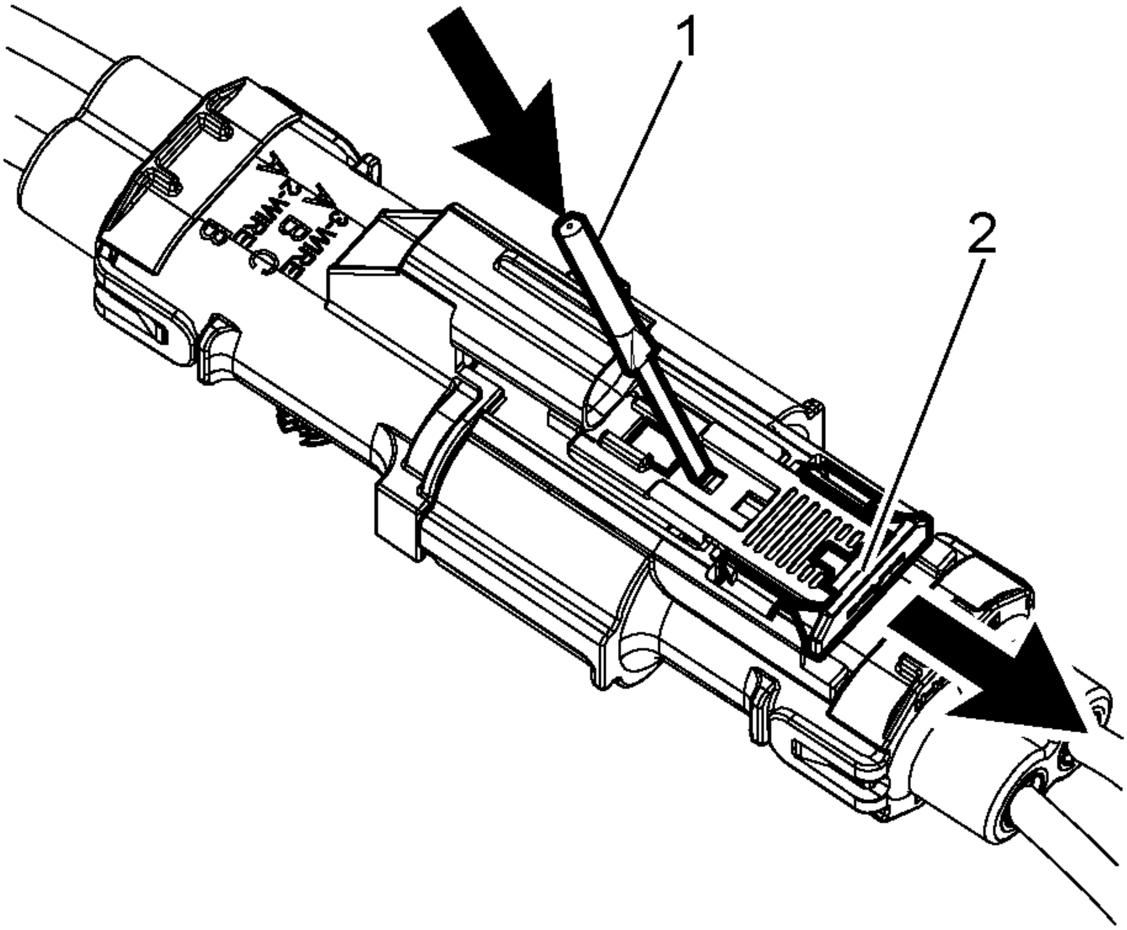

Fig. 19: Suitable Tool To Release Connector Position Assurance (CPA) Tab
Courtesy of GENERAL MOTORS COMPANY

1. Insert a suitable tool (1) and press firmly to release the connector position assurance (CPA) lock. Pull the CPA tab (2) back from the locked position to the pre-stage position. There will be an audible click sound when the CPA tab is in the correct position.

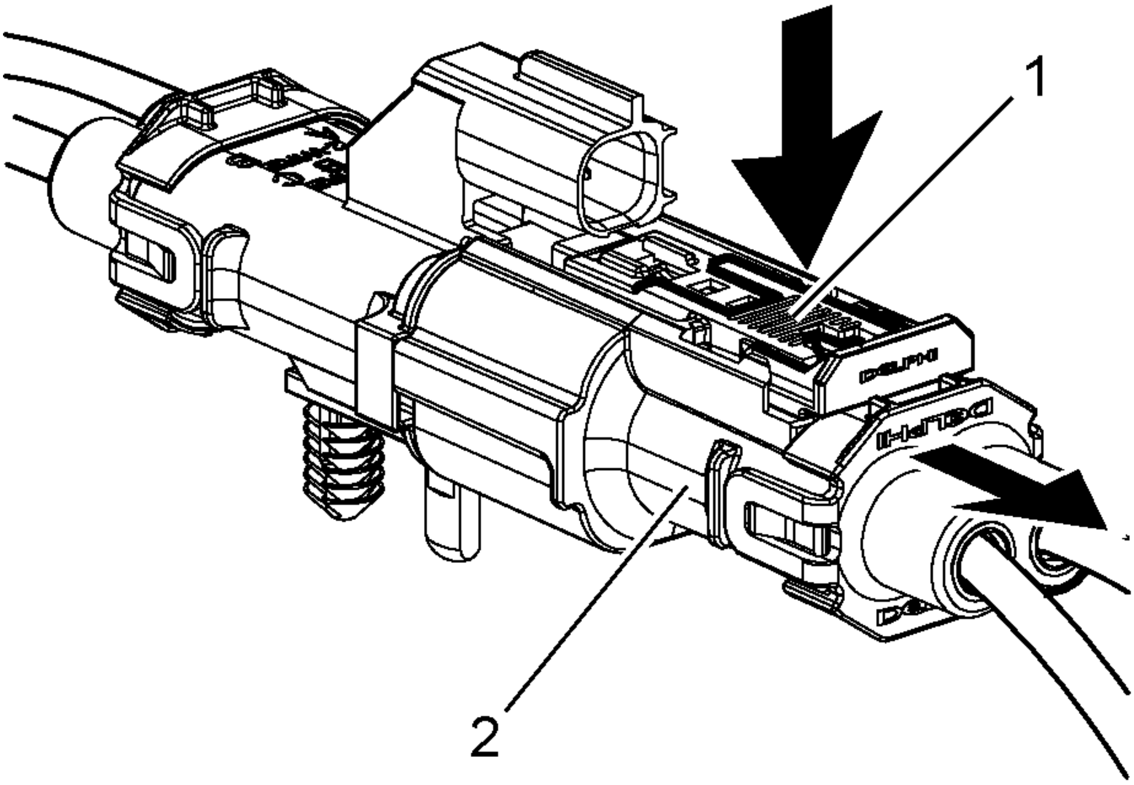

Fig. 20: Connector Lock And Female Connector
Courtesy of GENERAL MOTORS COMPANY

2. Depress the connector lock (1) and hold down. Keep the lock depressed and pull the female connector (2) apart to disconnect.

MP280 Connect Procedure

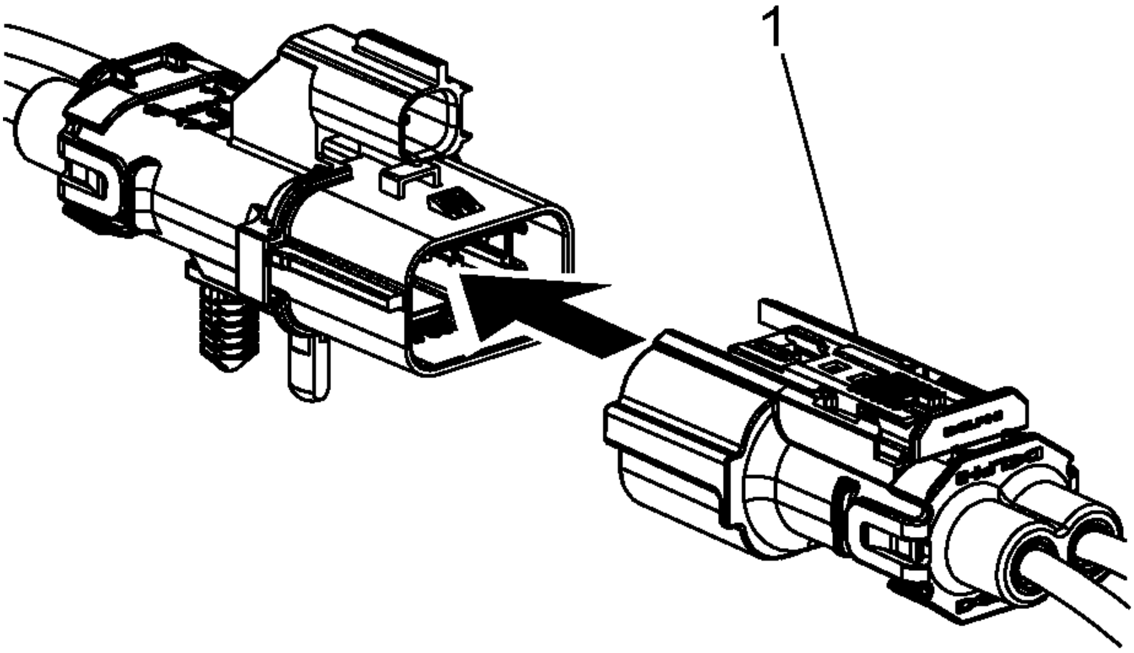

Fig. 21: Connector
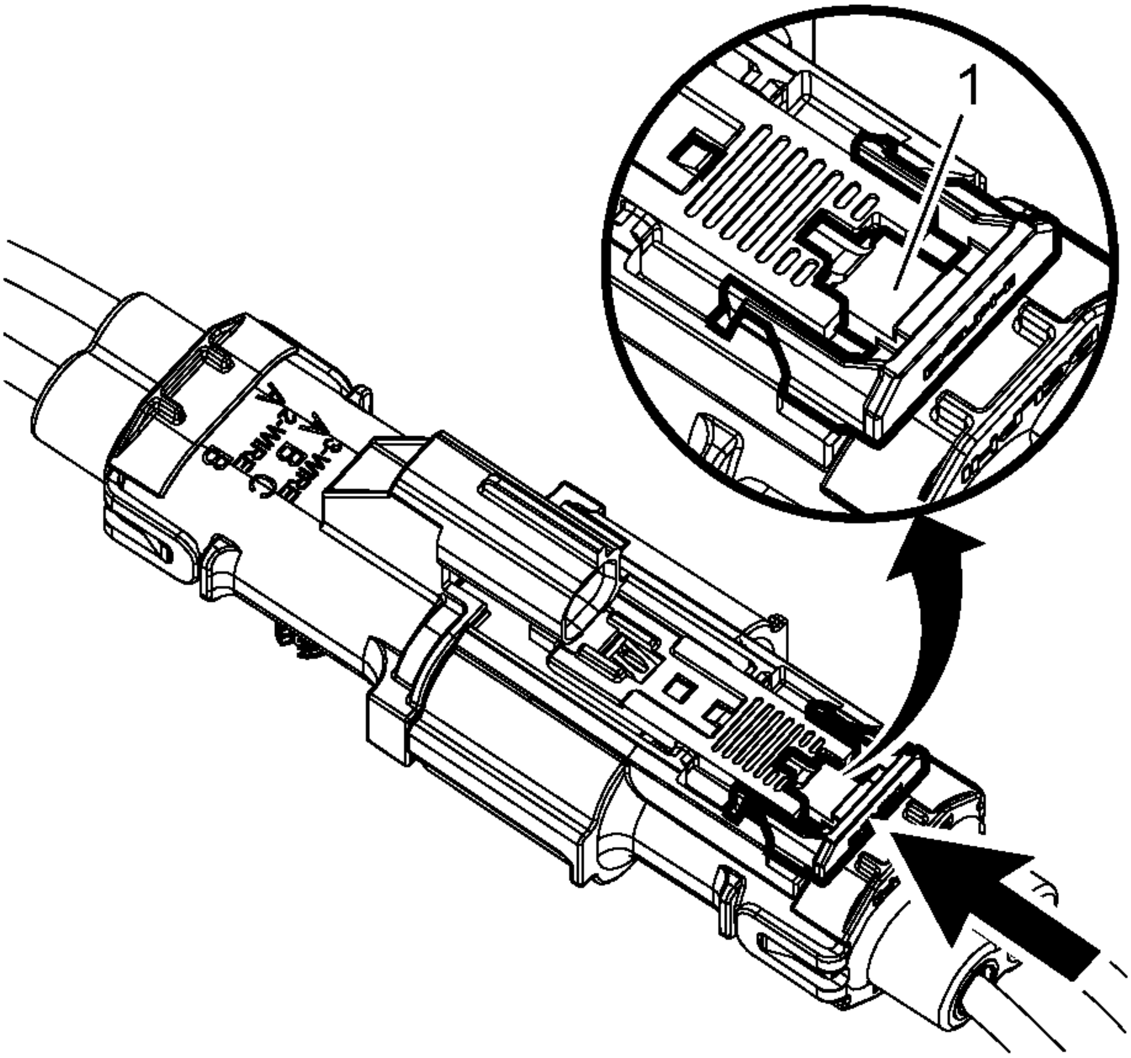
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure the CPA tab is in the pre-stage position.**

1. Align the connector (1) with the index features and install the connector. There will be an audible click sound when the connector is in the correct position.

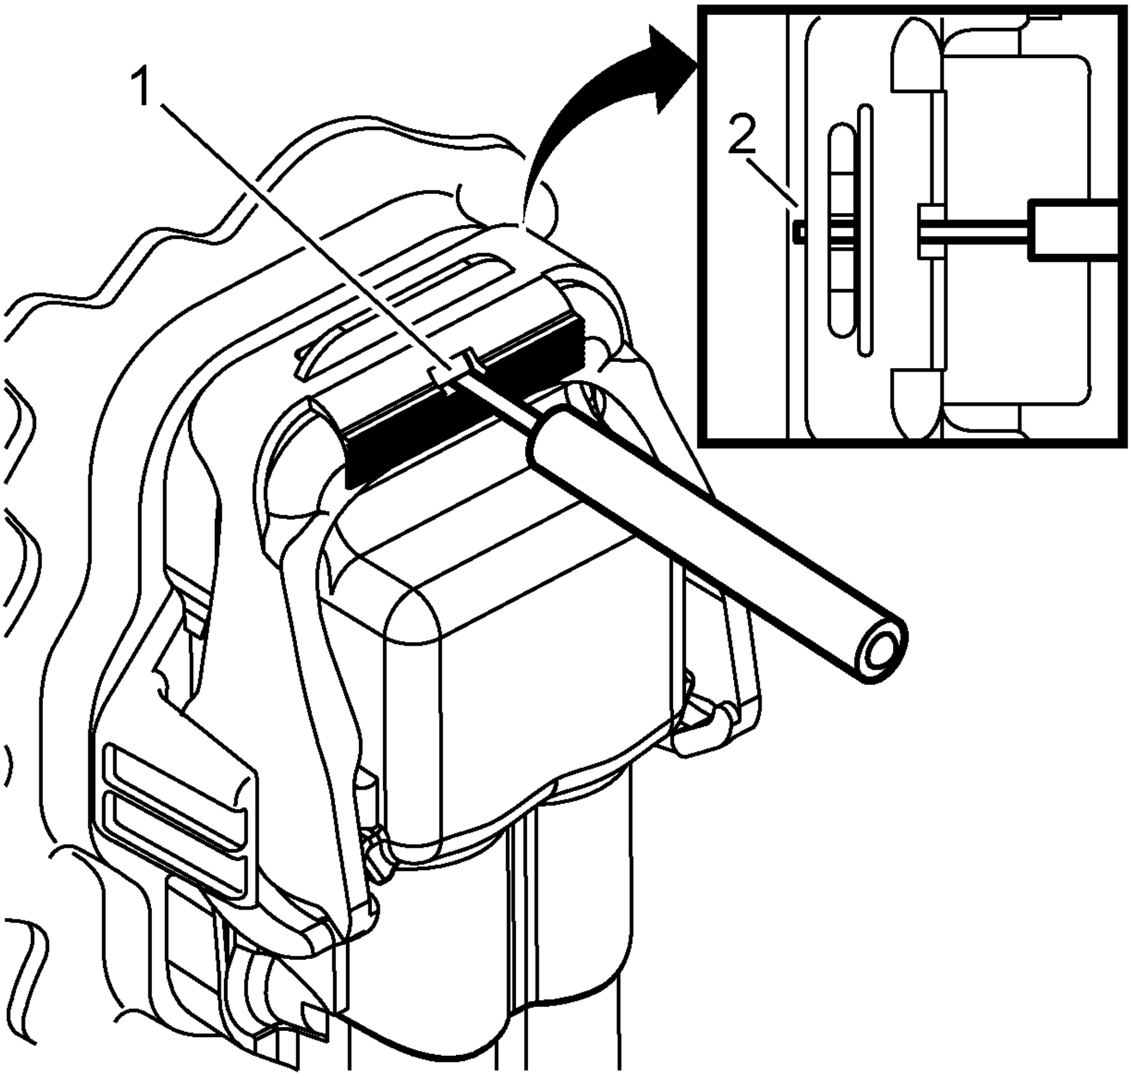


[Fig. 22: Connector Position Assurance (CPA) Tab](#)
Courtesy of GENERAL MOTORS COMPANY

2. Push the CPA tab (1) to lock the connector in the full-stage position. There will be an audible click sound when the CPA tab is in the correct position.

PP2000 90 NFS Connector Procedure

PP2000 90 NFS Disconnect Procedure



[Fig. 23: Using Tool Through Opening To Unlock Lever]

Courtesy of GENERAL MOTORS COMPANY

1. Place a suitable tool, such as a small flat-blade screwdriver, through the opening (1) at the front of the lever, and extend the tip down to near the base of the connector (2).
2. Rotate the tool slightly in either direction to unlock the lever.

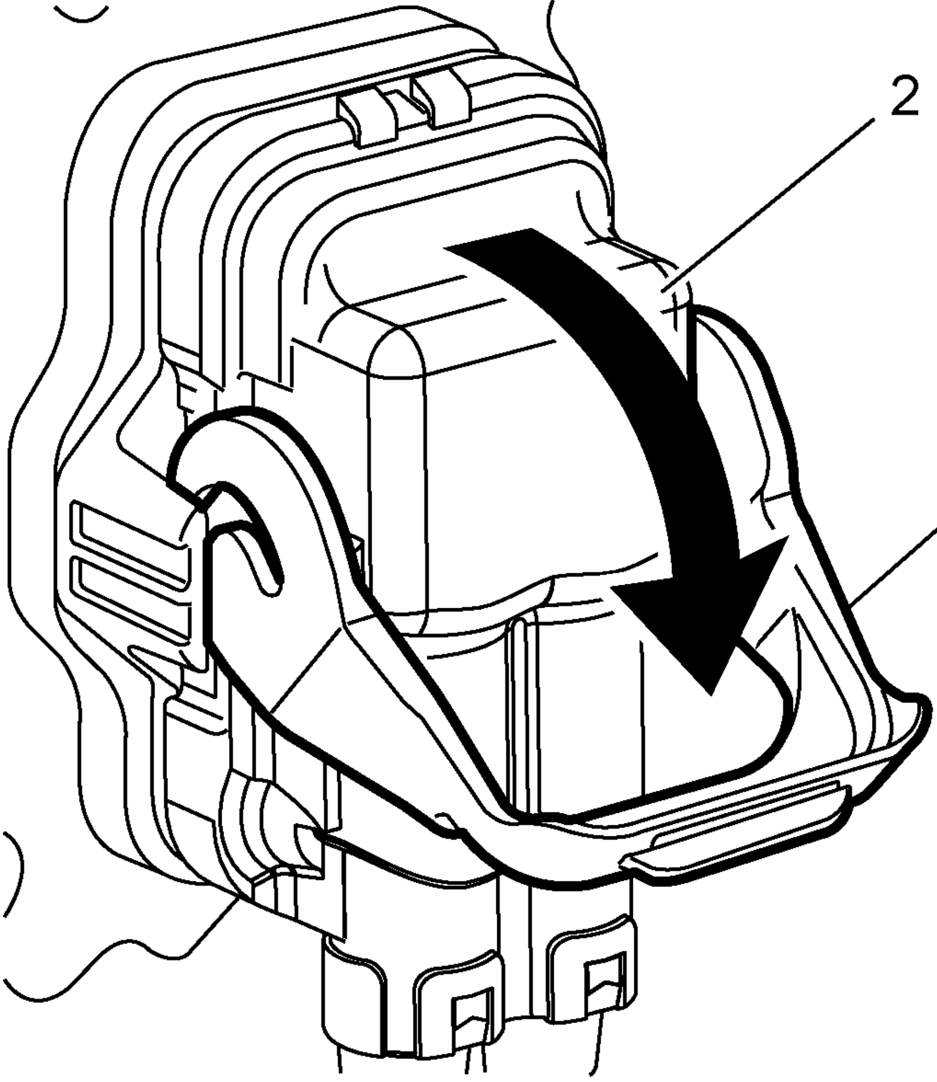


Fig. 24: Lever And Female Connector
Courtesy of GENERAL MOTORS COMPANY

3. Rotate the lever (1) to place the connector in a partial-mate position.
4. Remove the female connector (2) to complete the disconnection.

NOTE: **Always clean seal remnants from the connector with a non-marring tool.**

5. Inspect the High Voltage DC harness connector for seal residue or debris. Clean as necessary.
6. Inspect the High Voltage DC header connector seal for deformation or damage. Replace the DC connector header when seal damage is observed.

PP2000 90 NFS Connect Procedure

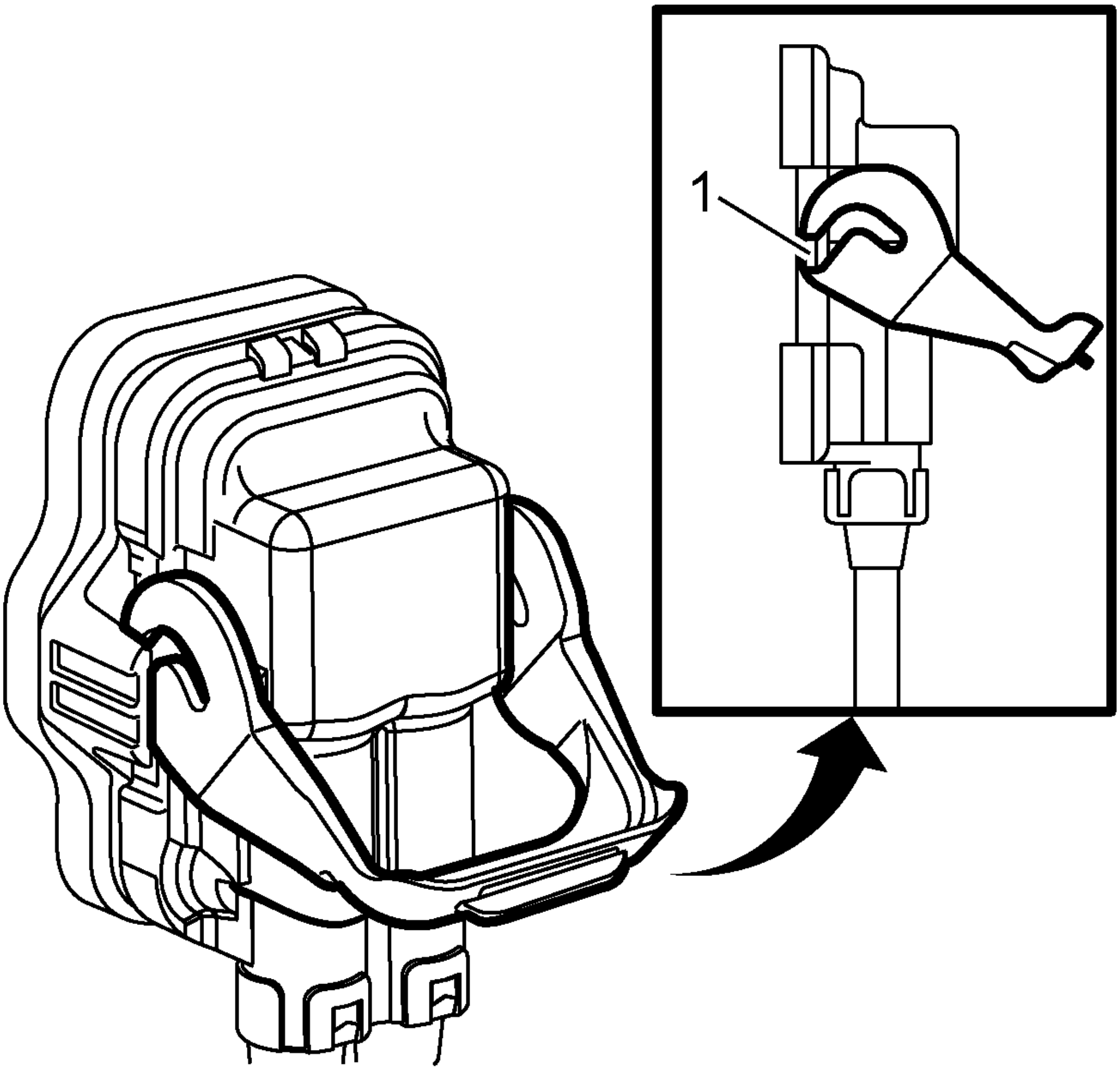

Fig. 25: Lever In Pre-Stage Assembly Position
Courtesy of GENERAL MOTORS COMPANY

1. Ensure the lever is in the pre-stage assembly position (1).

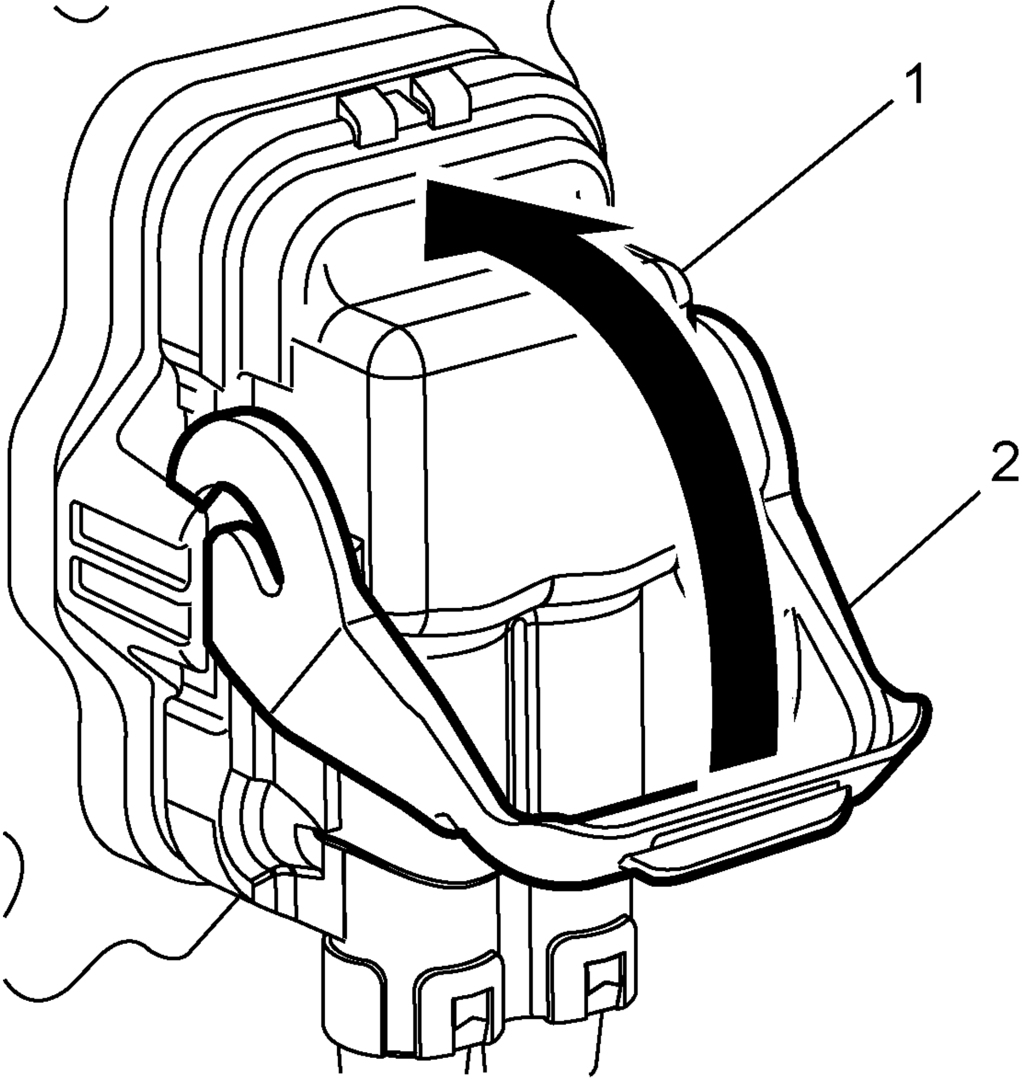

Fig. 26: Female Connector And Lever
Courtesy of GENERAL MOTORS COMPANY

2. Install the female connector (1) in the partial-mate position.
3. Rotate the lever (2) to place the connector in the full-mate position. There will be a very audible click sound when the lever locks in the full-stage position.

DTC P0A0C OR P0A0D: HIGH VOLTAGE SYSTEM INTERLOCK CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0A0C

High Voltage System Interlock Circuit Low Voltage

DTC P0A0D

High Voltage System Interlock Circuit High Voltage

Circuit/System Description

A high voltage interlock circuit is used to determine if access to high voltage components or connectors is being attempted. The opening of these high voltage components causes the high voltage interlock circuit to open. The hybrid/EV powertrain control module 2 sources about 5 V on the high voltage interlock circuit 1 loop. When the hybrid/EV powertrain control module 2 detects a loss of high voltage interlock circuit current, the high voltage contactors are commanded open.

The high voltage interlock circuit monitors for integrity of the S15 Manual Service Disconnect.

Conditions for Running the DTC

P0A0C

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV powertrain control module 2 is commanding 5 V on the high voltage interlock circuit.

P0A0D

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV powertrain control module 2 is commanding 0 V on the high voltage interlock signal circuit.

  OR

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV powertrain control module 2 is commanding 5 V on the high voltage interlock signal circuit.

Conditions for Setting the DTC

P0A0C

The hybrid/EV powertrain control module 2 detects high voltage interlock circuit 5 V low reference voltage is less than 30% of the commanded 5 V signal voltage.

P0A0D

- The hybrid/EV powertrain control module 2 detects high voltage interlock circuit 5 V low reference voltage is greater than 24% of the commanded 0 V signal voltage for 62.5 ms.

  OR

- The hybrid/EV powertrain control module 2 detects high voltage interlock circuit 5 V low reference voltage is greater than 44% of the commanded 5 V signal voltage for 75 ms.

Action Taken When the DTC Sets

- DTCs P0A0C and P0A0D are Type A DTCs.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

DTCs P0A0C and P0A0D are Type A DTCs.

Diagnostic Aids

- Test for a fully engaged hybrid battery pack high voltage S15 manual service disconnect whenever an open or intermittent high voltage interlock circuit condition is observed. The hybrid battery pack high voltage manual disconnect lever must be pressed down fully in order to completely engage the high voltage interlock circuit terminals.
- With all monitored high voltage components engaged and the High Voltage Interlock Circuit is Energized, observe the scan tool hybrid/EV powertrain control module 2 High Voltage Interlock Circuit Status parameter for a PASS status. To help identify intermittent conditions, manipulate the monitored components and inline connectors. An open interlock circuit will display a FAIL status.

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to Special Tools .

Circuit/System Verification

1. Verify all monitored high voltage components and connectors are connected.
2. Vehicle in Service Mode.
3. Observe the hybrid/EV powertrain control module 2 High Voltage Interlock Circuit Status parameter. Verify the parameter indicates a PASS condition.
    - **The parameter indicates a FAIL condition**

      Refer to Circuit/System Testing.

    - **The parameter indicates a PASS condition**
4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **An S15 Manual Service Disconnect that is not fully engaged may result in an intermittent DTC P0A0C.**

1. Disable high voltage at the A4 hybrid/EV battery pack. Refer to **High Voltage Disabling** procedure.
2. Verify that terminal 1 and terminal 2 of the S15 Manual Service Disconnect are not bent or broken and are OK.
   - **If not OK**

     Replace the S15 Manual Service Disconnect.

   - **If OK**
3. Test for 35 - 45 Ω between terminal 1 and terminal 2 of the S15 Manual Service Disconnect.
   - **If not within the specified range**

     Replace the S15 Manual Service Disconnect.

   - **If within the specified range**
4. With the S15 Manual Service Disconnect removed, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
5. Test for infinite resistance between each of the terminals listed below and ground;
   - Terminal 45
   - Terminal 47
   - **If less than infinite resistance**

     Repair the short to ground on the appropriate circuit.

   - **If infinite resistance**
6. Test for less than 10 Ω between the low reference circuit terminal 45 at the K114B Hybrid/EV Powertrain Control Module 2 and terminal 2 at the X21 Manual Service Disconnect Receptacle.
   - **If 10 Ω or greater**
   1. Disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
   2. Test for less than 10 Ω between the low reference circuit terminal 45 at the K114B Hybrid/EV Powertrain Control Module 2 and terminal 2 X358 harness connector.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω, replace the A4 Hybrid/EV Battery Pack internal harness.
   - **If less than 10 Ω**
7. Test for less than 10 Ω between the 5 V signal circuit terminal 47 at the K114B Hybrid/EV Powertrain Control Module 2 and terminal 1 at the X21 Manual Service Disconnect Receptacle.
   - **If not within the specified range**
   1. Disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
   2. Test for less than 10 Ω between the 5 V signal circuit terminal 47 at the K114B Hybrid/EV Powertrain Control Module 2 and terminal 1 X358 harness connector.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω
   3. Replace the A4 Hybrid/EV Battery Pack internal harness.
   - **If within the specified range**
8. Install the S15 Manual Service Disconnect ensuring the lever is fully engaged.
9. Connect the 12 V battery. Vehicle in Service Mode.
10. Test for less than 1 V between terminals listed below and ground;
    - Terminal 45
    - Terminal 47
    - **If 1 V or greater**

      Repair the short to voltage in the circuit.

    - **If less than 1 V**
11. Vehicle OFF. Disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
12. Test for 35 - 45 Ω between the 5 V signal circuit terminal 1 and low reference terminal 2 X358 harness connector.
    - **If not within the specified range**

      Replace the A4 Hybrid/EV Battery Pack internal harness.

- **If within the specified range**

13. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery High Voltage Manual Disconnect Lever Replacement** for S15 Manual Service Disconnect
- Refer to **Drive Motor Battery Control Module Wiring Harness Replacement** for A4 Hybrid/EV Battery Pack internal harness
- Refer to **Control Module References** for K114B Hybrid/EV Powertrain Control Module 2 replacement, programming and setup.

DTC P0A7F: HYBRID/EV BATTERY PACK LIFE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0A7F

Hybrid/EV Battery Pack Life

Circuit/System Description

The hybrid/EV powertrain control module 2 calculates the high voltage battery pack capability and determines the high voltage battery pack end of life.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 10.2 V.
- Hybrid battery temperature is greater than 20Â°C (68Â°F).
- Hybrid battery temperature is less than 50Â°C (122Â°F).
- Hybrid battery state of charge is between 30% and 100%.
- When the hybrid/EV powertrain control module 2 calculates the actual battery power has exceeded the power limits multiplied by seconds of duration is greater than 50%.
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0ABB, P0ABC, P0ABD, P0AC1, P0AC2, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0AF8, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P1A07, P1E8E, P1E8F, P1E90, P1E91, P1E93, P1E94, P1E95, P1E96, P1E97, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, P1EBA, P1EBB, U0111, U185A, U2401, U2603, U2604, U2605, or U2606.

Conditions for Setting the DTC

- Battery voltage and current is varying. Requires more than 10 minutes of city driving.
- When the hybrid/EV powertrain control module 2 calculates the power limits is less than the KW end of life power threshold.

Action Taken When the DTC Sets

DTC P0A7F is a type B DTC.

Conditions for Clearing the DTC

DTC P0A7F is a type B DTC.

Diagnostic Aids

Removing the manual service disconnect without being specifically instructed to do so during the High Voltage Disabling procedure may cause a DTC P0A7F to set.

Circuit/System Verification

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Removal of the manual service disconnect outside of the High Voltage Disabling procedure may cause a DTC P0A7F to set.**

1. Verify that no other DTCs are set.

    - **If any other DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **No other DTCs are set**
2. Verify DTC P0A7F is set.
    - **If DTC P0A7F is set**
    1. Clear the DTC. Vehicle OFF, disconnect the 12 V battery. Refer to **Battery Negative Cable Disconnection and Connection**
    2. Wait 30 seconds. Reconnect the 12 V battery. Refer to **Battery Negative Cable Disconnection and Connection**
    3. Review and operate the vehicle according to the DTC Conditions for Running. Operate the vehicle for more than 10 minutes of city driving.
    4. Verify that DTC P0A7F does not reset.
        - If DTC P0A7F resets
        1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
        2. Remove the A4 Hybrid/EV Battery Pack cover. Refer to **Battery Upper Cover Replacement** .
        3. Inspect all internal high voltage busbar/cable terminals for arc-flash damage.
            - If high voltage terminal damage is present, replace the effected components.
            - If high voltage terminal damage is not present, replace the A4 hybrid/EV battery pack.
        - If DTC P0A7F does not reset
    5. All OK.
    - **If DTC P0A7F is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)**

DTC P1EC3

Hybrid/EV Battery Pack Heater Transistor Control Circuit

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor and a precharge negative high voltage contactor. A transistor within the T24 Battery Charger controls the battery heater high voltage negative circuit. The contactors and transistor close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for each high voltage contactor/transistor. Ground is provided through a vehicle ground external of the high voltage battery.

Conditions for Running the DTC

P0AA1

- The main negative contactor is open.
- The main positive contactor has been open for more than 2 minutes.
- The charger positive contactor has been open for more than 2 minutes.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P0AF8, or P1A07.

P0AA4

- The main negative contactor is open.
- The main positive contactor has been open for more than 2 minutes.
- The charger positive contactor has been open for more than 2 minutes.

P0AD9, P0ADD, P0AE4, P0D0A, P1EC3 and P1EBD

The 12 V battery voltage is greater than 10.2 V.

P0D09

- The precharge contactor is closed.
- The negative contactor is open.
- The charger contactor is closed.
- Negative bus voltage is greater than 40 V.

P1EC0

- The 12 V battery voltage is greater than 10.2 V.
- The main positive and negative contactors have been closed.
- The charger positive contactor is closed.
- None of the following DTCs are set; P1AE8, P1AE9, or P1AEC.

Conditions for Setting the DTC

P0AA1

The positive bus voltage is greater than 30 V.

P0AA4

The negative bus voltage is greater than 30 V.

P0AD9, P0ADD and P0D0A

The hybrid/EV powertrain control module 2 has detected an open or short to voltage in the control circuit for the corresponding contactor.

P0AE4

The hybrid/EV powertrain control module 2 has detected a short to voltage in the control circuit.

P0D09

The battery charger sensed voltage is less than 10 V.

P1EBD

The battery charger sensed voltage is less than 80% of hybrid/EV battery voltage.

P1EC0

The main bus voltage is less than 80% of hybrid/EV battery voltage.

P1EC3

The hybrid/EV powertrain control module 2 has detected an open, short to ground or short to voltage in the heater transistor control circuit.

Actions Taken When the DTC Sets

- DTCs P0D09, P1EBD, or P1EC0 are type A DTCs.
- DTCs P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D0A, or P1EC3 are type B DTCs.

Conditions for Clearing the DTC

- DTCs P0D09, P1EBD, or P1EC0 are type A DTCs.
- DTCs P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D0A, or P1EC3 are type B DTCs.

Diagnostic Aids

DTC P1EC3 will prevent battery heating and the vehicle will be unable to start in cold weather with battery temperatures below -25Â°C (-13Â°F).

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0AD9, P0ADD, P0AE4, P0D0A, or P1EC3 is not set.
    - **If any of the DTCs are set**

      Refer to Circuit/System Testing, specific to the DTC or DTCs set.

    - **If none of the DTCs are set**
3. Verify that DTC P0AA1 and/or P0AA4 is set without any of the above contactor Control Circuit DTCs.
    - **If the DTC is set**

      Replace the A28 Hybrid/EV Battery Contactor Assembly.

    - **If the DTC is not set**
4. Connect the drive motor battery charger cable. Verify DTC P0D26 is not set and the vehicle will charge.
    - **If the DTC is set and the vehicle will not charge**

      Refer to DTC P0D26 .

    - **If the DTC is not set and the vehicle charges**
5. Verify that DTC P0C78 is not set.
    - **If the DTC is set**

      Refer to DTC P0C78 or P3061.

    - **If the DTC is not set**

NOTE: **The following setup steps must be performed exactly in order to exercise the contactors.**

6. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
7. OPEN the driver door using outside door handle. Leave driver door OPEN.

NOTE: **The parking lamps must remain ON throughout the remainder of the contactor steps.**

8. Turn ON the parking lamps.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode.**

9. Command the Hybrid/EV Battery Contactors ALL OPEN with a scan tool.
10. Disconnect the S15 Manual Service Disconnect.

NOTE: **DO NOT use the Release Control button to turn OFF any of the contactors. Once the Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning.**

11. Command the Hybrid/EV Battery Negative Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
12. Verify the Hybrid/EV Battery Negative Contactor should be heard closing and opening.
    - **If the Hybrid/EV Battery Negative Contactor does not open and close**

    Refer to Circuit/System Testing.

   - **If the Hybrid/EV Battery Negative Contactor does open and close**

13. Command the Hybrid/EV Battery Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
14. Verify the Hybrid/EV Battery Positive Contactor should be heard closing and opening.
    - **If the Hybrid/EV Battery Positive Contactor does not open and close**

      Refer to Circuit/System Testing.

    - **If the Hybrid/EV Battery Positive Contactor does open and close**
15. Command the Hybrid/EV Battery Precharge Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
16. Verify the Hybrid/EV Battery Precharge Contactor should be heard opening and closing.
    - **If the Hybrid/EV Battery Precharge Contactor does not open and close**

      Refer to Circuit/System Testing.

    - **If the Hybrid/EV Battery Precharge Contactor does open and close**
17. Command the Hybrid/EV Battery Charger Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
18. Verify the Hybrid/EV Battery Charger Contactor should be heard opening and closing.
    - **If the Hybrid/EV Battery Charger Contactor does not open and close**

      Refer to Circuit/System Testing.

    - **If the Hybrid/EV Battery Charger Contactor does open and close**
19. All OK.

Circuit/System Testing

NOTE: **You must perform Circuit/System Verification before proceeding.**

DTC P0AD9, P0ADD, P0AE4, or P0D0A Contactor Diagnosis

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
3. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
   - **If more than 10 Ω**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
5. Verify that a test lamp illuminates between the A4 Hybrid/EV Battery Pack harness B+ circuit terminal 1 X357 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
     1. Vehicle OFF.
     2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K16 Battery Energy Control Module and hybrid/EV battery pack internal wiring harness.

- **If the test lamp illuminates**

6. Vehicle in Service Mode.
7. Verify that a test lamp does not illuminate between each A4 Hybrid/EV Battery Pack harness connector control circuit terminals listed below and ground:
   - Terminal 3 X358
   - Terminal 4 X358
   - Terminal 5 X358
   - Terminal 7 X358
   - **If the test lamp illuminates on any circuit**
   1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.
   - **If the test lamp does not illuminate on all circuits**
8. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.
9. Test for infinite resistance between each A4 Hybrid/EV Battery Pack harness connector control circuit terminals listed below and ground:
   - Terminal 3 X358
   - Terminal 4 X358
   - Terminal 5 X358
   - Terminal 7 X358
   - **If less than infinite resistance on either circuit**

     Repair the short to ground on the circuit.

   - **If infinite resistance on both circuits**
10. Test for less than 2 Ω between the harness connector terminals listed below:
    - Terminal 3 X358 at the A4 Hybrid/EV Battery Pack and terminal 9 X1 at the K114B Hybrid Powertrain Control Module 2
    - Terminal 4 X358 at the A4 Hybrid/EV Battery Pack and terminal 6 X1 at the K114B Hybrid Powertrain Control Module 2
    - Terminal 7 X358 at the A4 Hybrid/EV Battery Pack and terminal 8 X1 at the K114B Hybrid Powertrain Control Module 2
    - Terminal 5 X358 at the A4 Hybrid/EV Battery Pack and terminal 3 X1 at the K114B Hybrid Powertrain Control Module 2
    - **If 2 Ω or greater on any circuit**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω on all circuits**
11. Replace the A28 Hybrid/EV Battery Contactor Assembly.
12. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D0A, P0D09, P1EBD, P1EC0, P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If any of the DTCs set**

      Replace the K114B Hybrid Powertrain Control Module 2.

    - **If none of the DTCs are set**
13. All OK.

P1EC3 - Hybrid/EV Battery Pack Heater Transistor Diagnosis

1. Vehicle OFF, disconnect the X9 low voltage harness connector at the T24 Battery Charger.
2. Vehicle in Service Mode.
3. Verify that a test lamp does not illuminate between the T24 Battery Charger harness control circuit terminal 6 and ground.
   - **If the test lamp illuminates**

    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.
  - **If the test lamp does not illuminate**
4. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.
5. Test for infinite resistance between the T24 Battery Charger harness control circuit terminal 6 and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**

      Test for less than 2 Ω in the control circuit end to end.

    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
6. Replace the T24 Battery Charger.
7. Verify that DTC P1EC3 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If the DTC is set**

      Replace the K114B Hybrid Powertrain Control Module 2.

    - **If the DTC is not set**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **High Voltage Battery Disconnect Relay Replacement** for A28 Hybrid/EV battery contactor assembly replacement.
- Refer to **High Voltage Battery Control Wiring Junction Block Replacement (With quick charge)** **High Voltage Battery Control Wiring Junction Block Replacement (Without quick charge)** for T24 battery charger replacement.
- Refer to **Control Module References** for K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0AA6 OR P1AE6: HYBRID/EV BATTERY AND/OR BATTERY ENERGY CONTROL MODULE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0AA6

Hybrid/EV Battery Voltage System Isolation Lost

DTC P1AE6

Battery Energy Control Module Hybrid/EV Battery Voltage Isolation Sensor Circuit

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the battery energy control module high voltage isolation monitor circuit is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground. The battery energy control module isolation monitoring method is sometimes referred to as the active isolation monitor. The hybrid powertrain control module 2 requests the battery energy control module to perform this test. Measurement values are reported to the hybrid powertrain control module 2, which makes the determination of an isolation fault.

The isolation check for P0AA6 Hybrid Battery Voltage System Isolation Lost runs when all the contactors are open. This check monitors isolation in the battery system. This check runs only once during the time that the hybrid powertrain control module 2 is awake and runs after the contactors have been open for 35 seconds. This monitor typically runs when the vehicle is turned off after a drive. It could also run when the vehicle is first started, if there is a long enough period between the hybrid powertrain control module 2 waking up and the main contactors closing.

The battery energy control module runs an internal self check of this sensor circuit. When this test fails, DTC P1AE6 will be set.

Conditions for Running the DTC

P0AA6

- The hybrid powertrain control module 2 and battery energy control module are awake and communicating
- All the contactors have been open for 35 s.

P1AE6

- The 12 V battery voltage is greater than 9 V.
- The hybrid powertrain control module 2 and battery energy control module are awake and communicating.
- The hybrid powertrain control module 2 has requested the battery energy control module to run the isolation test.
- The main contactors are open.
- DTC U185B is not set.

Conditions for Setting the DTC

P0AA6

- The battery energy control module has detected active isolation resistance is less than 265K Ω if P0AA6 has not failed, or less than 318K Ω if P0AA6 has failed at least once.
- 5 out of 10 tests have failed, one test is run per Hybrid/EV powertrain control module 2 wake-up cycle.

P1AE6

The battery energy control module has detected a fault with the active isolation sensing circuits.

Actions Taken When the DTC Sets

P0AA6 and P1AE6 are Type A DTCs.

Conditions for Clearing the DTC

- P0AA6 and P1AE6 are Type A DTCs.
- P0AA6 requires one passing test at greater than 318K Ω resistance.

Diagnostic Aids

- A single high voltage contactor stuck closed may set this DTC.
- Liquid intrusion into the hybrid/EV battery pack may cause P0AA6 or P1AE6 to set.

Circuit/System Verification

1. Verify that DTC P0A7E, P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0C32, P0D0A, P0D09, P1EBD, P1EC0 or P1EC3 is not set.
    - **If any DTC is set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If none of the DTCs are set**
2. Verify that DTC P1AE6 is set and P0AA6 is not set.
    - **If DTC P1AE6 is set without DTC P0AA6**
    1. Verify the K114B Hybrid Powertrain Control Module 2 has the latest calibration in Calibration Information.
        - If the K114B Hybrid Powertrain Control Module 2 does not have the latest calibration, program the K114B Hybrid Powertrain Control Module 2 first, and then also replace the K16 Battery Energy Control Module.
        - If the K114B Hybrid Powertrain Control Module 2 has the latest calibration
    2. Replace the K16 Battery Energy Control Module.
    - **If both DTCs are set, or only DTC P0AA6 is set**
3. Verify with a scan tool the hybrid powertrain control module 2, Isolation Test Resistance parameter is greater than 318k Ω.
    - **If the parameter is 318k Ω or less**

      Refer to Circuit/System Testing.

    - **If the parameter is greater than 318k Ω**
4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
2. Replace the A4 Hybrid/EV Battery Pack.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)** for A4 Hybrid/EV Battery Pack replacement.
- Refer to **Control Module References** for K16 battery energy control module replacement, programming and setup.

DTC P0ABB, P0ABC, OR P0ABD: HYBRID/EV BATTERY VOLTAGE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0ABB

Hybrid/EV Battery Voltage Sensor Performance

DTC P0ABC

Hybrid/EV Battery Voltage Sensor Circuit Low Voltage

DTC P0ABD

Hybrid/EV Battery Voltage Sensor Circuit High Voltage

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors individual cell voltage readings from the battery energy control module. The battery energy control module monitors the voltage of the 96 battery cell groups. Voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on each end of the of the battery module. A voltage sense harness joins this connector to the battery energy control module.

Conditions for Running the DTC

P0ABB

- The hybrid/EV powertrain control module 2 and battery energy control module are awake and communicating.
- No other DTCs are set.

P0ABC and P0ABD

- The hybrid/EV powertrain control module 2 and battery energy control module are awake and communicating.

- The 12 V battery voltage is greater than 10.2 V.
- DTC P1A07 is not set.

Conditions for Setting the DTC

P0ABB

The hybrid/EV powertrain control module 2 detects difference of 12 V between the average cell group voltage multiplied by 96 and the voltage measured at battery side of the main contactors.

P0ABC

The battery energy control module detects the terminal voltage is less than 24 V on the battery side of the main contactors.

P0ABD

The battery energy control module detects the terminal voltage is greater than 479 V on the battery side of the main contactors.

Actions Taken When the DTC Sets

- DTCs P0ABB, P0ABC, and P0ABD are Type A DTCs.
- The vehicle will operate in a reduced power mode.

Conditions for Clearing the DTC

DTCs P0ABB, P0ABC, and P0ABD are Type A DTCs.

Diagnostic Aids

- The hybrid/EV battery pack high voltage manual service disconnect is out, not installed correctly, or a blown manual service disconnect fuse may cause P0ABB and/or P0ABC to set.
- The hybrid/EV battery pack high voltage manual service disconnect was removed, out of sequence, or was out during a service procedure with the 12 V battery connected may cause P0ABB and/or P0ABC to set.

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

- The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group.

For equivalent regional tools, refer to Special Tools .

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that no other DTCs are set.
   - **If any DTCs are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle

   - **If no other DTCs are set**
3. Verify and record with a scan tool, the battery energy control module Hybrid Battery Pack Terminal 1 Voltage parameter and the hybrid/EV powertrain control module 2 Hybrid Battery Pack Voltage parameters are between 205 - 419 V and within 12 V of each other.
   - **If not within the specified range and not within 12 V of each other**

     Refer to Circuit/System Testing.

   - **If within the specified range and within 12 V of each other**
4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**
2. Remove the S15 Manual Service Disconnect.
3. Test for less than 10 Ω across the S15 Manual Service Disconnect fuse terminals.
    - **If 10 Ω or greater**

      Replace the S15 Manual Service Disconnect.

    - **If less than 10 Ω**
4. Remove the A4 hybrid/EV battery pack cover. Refer to **Battery Upper Cover Replacement** .

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

5. Disconnect all K16 battery energy control module connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
6. Inspect the harness connectors and the K16 battery energy control module connectors for corrosion.
    - **If corrosion is present**

      Replace the Hybrid/EV Battery Pack Internal Harness and the K16 Battery Energy Control Module as applicable.

    - **If corrosion is not present**

NOTE: **The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group.**

7. Disconnect the harness connectors at C5A Hybrid/EV Battery Module 1 and C5J Hybrid/EV Battery Module 10.
8. Inspect the harness connectors and the appropriate C5A and C5J Hybrid/EV Battery module connectors for corrosion.
    - **If corrosion is present**

      Replace the A4 Hybrid/EV Battery Pack Internal Harness and the C4A Hybrid/EV Battery Section 1.

    - **If corrosion is not present**
9. Connect the **EL-48571** High Voltage Battery Pin Out Box with the **EL-48571-63** adapter to the C5A Hybrid/EV Battery Module 1 connectors. Refer to **EL-48571 High Voltage Battery Pin Out Box Reference** for proper X1, X2 orientation.
10. Insert the DMM probes into the **EL-48571** High Voltage Battery Pin Out Box test cavities.
11. Measure and record the voltage of each of the cell groups by cycling the **EL-48571** High Voltage Battery Pin Out Box through each of the switch positions. Refer to **EL-48571 High Voltage Battery Pin Out Box Reference**.
12. Verify each cell group voltage reading is between 3.28-4.16 V.
    - **If not within the specified range**

      Replace the C4A Hybrid/EV Battery Section 1.

    - **If within the specified range**
13. Verify each cell group voltage reading is within 0.03 V of each other.
    - **If greater than 0.03 V**

      Replace the C4A Hybrid/EV Battery Section 1.

- **If 0.03 V or less**

14. Connect the **EL-48571** High Voltage Battery Pin Out Box with the **EL-48571-63** adapter to the C5J Hybrid/EV Battery Module 10 connectors. Refer to **EL-48571 High Voltage Battery Pin Out Box Reference** for proper X1, X2 orientation.
15. Insert the DMM probes into the **EL-48571** High Voltage Battery Pin Out Box test cavities.
16. Measure and record the voltage of each of the cell groups by cycling the **EL-48571** High Voltage Battery Pin Out Box through each of the switch positions. Refer to **EL-48571 High Voltage Battery Pin Out Box Reference**.
17. Verify each cell group voltage reading is between 3.28-4.16 V.
    - **If not within the specified range**

      Replace the C4A Hybrid/EV Battery Section 1.

    - **If within the specified range**
18. Verify each cell group voltage reading is within 0.03 V of each other.
    - **If greater than 0.03 V**

      Replace the C4A Hybrid/EV Battery Section 1.

    - **If 0.03 V or less**
19. Replace the Hybrid/EV Battery Pack Internal Harness and the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Cell Battery Module Replacement (Row 1)** **Cell Battery Module Replacement (Row 2)** **Cell Battery Module Replacement (Row 3)** **Cell Battery Module Replacement (Row 4)** **Cell Battery Module Replacement (Row 5)** for C4A Hybrid/EV Battery Section 1 replacement.
- Refer to **Drive Motor Battery Sensor Module Wiring Harness Replacement (Left)** **Drive Motor Battery Sensor Module Wiring Harness Replacement (Right)** **Drive Motor Battery Sensor Module Wiring Harness Replacement (LH, Sub)** **Drive Motor Battery Sensor Module Wiring Harness Replacement (RH, Sub)** for Hybrid/EV Battery Pack Internal Harness replacement.
- Refer to **Control Module References** for K16 battery energy control module replacement, programming and setup.

DTC P0AC1, P0AC2, P0B10, P0B11, P0B13, P1EBA, OR P1EBB: HYBRID/EV BATTERY LOW/HIGH RESOLUTION CURRENT SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC P0B13

Hybrid/EV Battery Low Resolution Current Sensor - High Resolution Current Sensor Not Plausible

DTC P1EBA

Hybrid/EV Battery Low Resolution Current Sensor Exceeded Learning Limit

DTC P1EBB

Hybrid/EV Battery High Resolution Current Sensor Exceeded Learning Limit

Circuit/System Description

The hybrid/EV battery current sensor is mounted inside the hybrid/EV battery pack. The negative high voltage cable that goes to the main contactor relay passes through the hybrid/EV battery pack current sensor. The hybrid/EV battery pack current sensor detects the amperage that flows in and out of the hybrid/EV batteries. The battery energy control module supplies and monitors a 5 V reference signal to the hybrid/EV battery pack current sensor. The hybrid/EV battery pack current sensor returns a signal between 0 and 5 V to the battery energy control module. The hybrid/EV battery pack current sensor signal is in proportion to the amperage going in and out of the hybrid/EV battery pack. The hybrid/EV battery pack current sensor has 2 measurement ranges in order to maintain accuracy. The ranges are low resolution and high resolution. The measurement ranges of the hybrid/EV battery pack current sensor have some overlap with each other. A signal voltage of the high resolution hybrid/EV battery pack current sensor greater than 2.5 V indicates that the hybrid/EV battery is being charged, and a signal voltage less than 2.5 V indicates discharging. A signal voltage of the low resolution hybrid/EV battery pack current sensor greater than 3.24 V indicates that the hybrid/EV battery is being charged and a signal voltage less than 3.24 V indicates discharging. The high resolution measures from -20 to +20 A. The low resolution measures from -500 to +230 A.

Conditions for Running the DTC

P0AC1, P0AC2, P0B10, and P0B11

- The 12 V battery voltage is greater than 10.2 V.
- The battery energy control module is awake and communicating.

P0B13

- The hybrid/EV battery low resolution current sensor or the hybrid/EV battery high resolution current sensor value is between -20 and +20 A.
- None of the following DTCs are set: P0AC1, P0AC2, P1EBA, P0B10, P0B11, P1EBB, U0111, U185A.

P1EBA and P1EBB

- Runs during battery energy control module initialization.
- The 12 V battery voltage is greater than 10.2 V.
- The high voltage main and charger contactors are open (during wake-up).
- DTC U185B is not set.

Conditions for Setting the DTC

P0AC1

The battery energy control module detects that the hybrid/EV battery pack current sensor low resolution is less than -555 A.

P0AC2

The battery energy control module detects that the hybrid/EV battery pack current sensor low resolution is greater than +285 A.

P0B10

The battery energy control module detects that the hybrid/EV battery pack current sensor high resolution is less than -23 A.

P0B11

The battery energy control module detects that the hybrid/EV battery pack current sensor high resolution is greater than +23 A.

P0B13

The difference between the Hybrid/EV Battery's low resolution current sensor value and its high resolution current sensor value is greater than 10 A.

P1EBA

The battery energy control module detects that the Pack Current Low Resolution Offset is greater than the calibration Low Resolution Offset of 8 A.

P1EBB

The battery energy control module detects that the Pack Current High Resolution Offset is greater than the calibration High Resolution Offset of 2.5 A.

Action Taken When the DTC Sets

- DTC P0AC1, P0AC2, P0B10, P0B11, P1EBA and P1EBB are type A DTCs.
- The vehicle will operate in a reduced power mode.

Conditions for Clearing the DTC

DTC P0AC1, P0AC2, P0B10, P0B11, P1EBA and P1EBB are type A DTCs.

Diagnostic Aids

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

Refer to **Battery Energy Control Module Replacement** .

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Vehicle in Service Mode, all accessories OFF.

   NOTE: **Typical current in a parked vehicle with the Vehicle in Service Mode and all accessories OFF is between 1 A and 10 A.**

2. Verify the scan tool battery energy control module Hybrid/EV Battery Pack Low Resolution Current Sensor parameter is between -555 A and +285 A and changes with the amount of current draw on the hybrid/EV battery pack.
   - **If not within the specified range**

     Refer to Circuit/System Testing.

   - **If within the specified range**

   NOTE: **Typical current in a parked vehicle with the Vehicle in Service Mode and all accessories OFF is between 1 A and 10 A.**

3. Verify the scan tool Hybrid/EV Battery Pack High Resolution Current Sensor parameter is between -23 A and +23 A, and changes with the amount of current draw on the hybrid/EV battery pack.
   - **If not within the specified range**

     Refer to Circuit/System Testing.

   - **If within the specified range**
4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
2. Remove the A4 Hybrid/EV Battery Pack cover. Refer to **Battery Upper Cover Replacement** .

3. Connect the **EL-50214** low voltage jumper harness extension.
4. Disconnect the A28 Hybrid/EV Battery Contactor Assembly connector.
5. Connect the 12 V battery, vehicle OFF.
6. Test for less than 10 Ω between the low reference circuit terminal 13 and ground.
   - **If 10 Ω or greater**
     1. Vehicle OFF, disconnect the X7 harness connector at the K16 Battery Energy Control Module.
     2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
   - **If less than 10 Ω**
7. Vehicle in Service Mode.
8. Test for 4.8 - 5.5 V between the 5 V reference circuit terminal 12 and ground.
   - **If less than 4.8 V**
     1. Vehicle OFF, disconnect the X7 harness connector at the K16 Battery Energy Control Module.
     2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
     3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
   - **If greater than 5.5 V**
     1. Vehicle OFF, disconnect the X7 harness connector at the K16 Battery Energy Control Module, vehicle in Service Mode.
     2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
   - **If within the specified range**
9. Verify the scan tool Hybrid/EV Battery Pack High Resolution Current Sensor parameter is less than 0 A.
   - **If 0 A or greater**
     1. Vehicle OFF, disconnect the X7 harness connector at the K16 Battery Energy Control Module, vehicle in Service Mode.
     2. Test for less than 1 V between the A28 Hybrid/EV battery contactor assembly connector signal circuit terminal 14 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
   - **If less than 0 A**
10. Install a 3 A fused jumper wire between the A28 Hybrid/EV battery contactor assembly connector signal circuit terminal 14 and the 5 V reference circuit terminal 12.
11. Verify the scan tool Hybrid/EV Battery Pack High Resolution Current Sensor parameter is greater than 0 A.
    - **If 0 A or less**
      1. Vehicle OFF, disconnect the X7 harness connector at the K16 Battery Energy Control Module.
      2. Test for infinite resistance between the signal circuit and ground.
         - If less than infinite resistance, repair the short to ground on the circuit.
         - If infinite resistance
      3. Test for less than 2 Ω in the signal circuit end to end.
         - If 2 Ω or greater, repair the open/high resistance in the circuit.

    - If less than 2 Ω, replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
  - **If greater than 0 A**

12. Verify the scan tool Hybrid/EV Battery Pack Low Resolution Current Sensor parameter is less than 100 A.
    - **If 100 A or greater**
    1. Vehicle OFF, disconnect the X7 harness connector at the K16 Battery Energy Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the A28 Hybrid/EV battery contactor assembly connector signal circuit terminal 11 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
    - **If less than 100 A**
13. Install a 3 A fused jumper wire between the A28 Hybrid/EV battery contactor assembly connector signal circuit terminal 11 and the 5 V reference circuit terminal 12.
14. Verify with a scan tool, the Hybrid/EV Battery Pack Low Resolution Current Sensor parameter is greater than 100 A.
    - **If less than 100 A**
    1. Vehicle OFF, disconnect the X7 harness connector at the K16 Battery Energy Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
    - **If 100 A or greater**
15. Replace the B30 Hybrid/EV Battery Pack Current Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **High Voltage Battery Disconnect Relay Replacement** for B30 Hybrid/EV Battery Pack Current Sensor replacement
- Refer to **Drive Motor Battery Control Module Wiring Harness Replacement**
- Refer to **Control Module References** for K16 battery energy control module replacement, programming, and setup.

DTC P0AF8: HYBRID SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0AF8

Hybrid System Voltage

Circuit/System Description

The high voltage hybrid/EV battery contains 288 individual cells. Three cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid/EV battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.65 V, for a nominal system voltage of 350 V direct current. The battery cell groups are electrically joined to form 10 distinct electrical modules.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at connectors located on the side of the battery cell module. A voltage sense harness joins this connector to the battery energy control module.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

- The hybrid/EV battery main contactors are closed.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P1A07, P1AE8, P1AE9, P1AEA, P1AEB, P1AEC, P1AED, P1E20, P1E21, P1E28, or U1817.

OR

- Battery charging is active.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P1AF5, P1B0C, P1B41, P1B42, P1B44, P1ED1, P1EF1, P1E1B, U1817.

Conditions for Setting the DTC

- The difference between the Hybrid/EV Battery pack voltage and the hybrid/EV powertrain control module 1 bus voltage is greater than 16 V.

  OR

- The difference between the Hybrid/EV Battery pack voltage and the charger module's bus voltage is greater than 16 V.

Action Taken When the DTC Sets

- DTC P0AF8 is a type A DTC.
- The vehicle will operate in a reduced power mode.

Conditions for Clearing the DTC

DTC P0AF8 is a type A DTC.

Diagnostic Aids

- An open high voltage fuse for the T18 Battery Charger may cause DTC P0AF8 to set.
- DTC P1EC0 may set a DTC P0AF8 if the vehicle is ON or vehicle in service mode while the contactors are stuck OPEN

Circuit/System Verification

1. Verify that no other DTCs are set.
    - **If any DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle

    - **If no DTCs are set**
2. Ensure the battery charge cord is not connected.
3. Vehicle ON.

   NOTE: **The contactors must be closed.**

4. Verify with a scan tool, the hybrid/EV powertrain control module High Voltage Circuit and the battery energy control module Hybrid/EV Battery Pack Terminal 1 Voltage are within 16 V of each other and DTC P0AF8 did not reset.
    - **If the parameters are not within 16 V of each other or DTC P0AF8 is set**

      Refer to Circuit/System Testing, Battery Main Bus Diagnostics.

    - **If the parameters are within 16 V of each other and DTC P0AF8 is not set**
5. Connect the battery charge cord.
6. Verify with a scan tool, the hybrid/EV powertrain control module 2 Battery Charger High Output and the battery energy control module Hybrid Battery Pack Terminal 1 Voltage are within 16 V of each other and DTC P0AF8 did not reset.
    - **If the parameters are not within 16 V of each other or DTC P0AF8 is set**

      Refer to Circuit/System Testing, Battery Charger Bus Diagnostics.

    - **If the parameters are within 16 V of each other and DTC P0AF8 is not set**
7. All OK

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

Battery Charger Bus Diagnostics

1. Vehicle OFF, disable the high voltage at the T18 Battery Charger and the T24 Battery Charger-DC. Refer to **High Voltage Disabling**.
2. Disconnect the T18 Battery Charger high voltage DC connector.
3. Disconnect the K1 14 V Power Module high voltage connector.
4. Disconnect the T24 Battery Charger-DC high voltage connectors X6 and X7.
5. Disconnect the X4 harness connector at the A4 Hybrid/EV Battery Pack.
6. Test for infinite resistance between the High voltage DC (+360 V) positive terminal A and the high voltage DC (-360 V) negative terminal B X4 harness connector.
    - **If less than infinite resistance**

      Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

    - **If infinite resistance**
7. Test for less than 10 Ω between the terminals listed below:
    - High voltage DC (-360 V) negative terminal B X7 harness connector at the T24 Battery Charger-DC and the high voltage DC (-360 V) negative terminal B X4 harness connector at the A4 Hybrid/EV Battery Pack.
    - High voltage DC (+360 V) positive terminal A X7 harness connector at the T24 Battery Charger-DC and the high voltage DC (+360 V) negative terminal A X4 harness connector at the A4 Hybrid/EV Battery Pack.
    - **If 10 Ω or greater**

      Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

    - **If less than 10 Ω**
8. Test for less than 10 Ω between the terminals listed below:
    - High voltage DC (-360 V) negative terminal B X6 harness connector at the T24 Battery Charger-DC and the high voltage DC (-360 V) negative terminal B X3 harness connector at the T18 Battery Charger.
    - High voltage DC (+360 V) positive terminal A X6 harness connector at the T24 Battery Charger-DC and the high voltage DC (+360 V) negative terminal A X3 harness connector at the T18 Battery Charger.
    - **If 10 Ω or greater**

      Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

    - **If less than 10 Ω**

NOTE: **The T18 battery charger Fuse is located within the A28 Hybrid/EV Battery Contactor Assembly.**

9. Replace the T18 Battery Charger, K1 14 V Power Module and the T18 Battery Charger fuse, if open.
10. Verify that DTC P0AF8 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If DTC P0AF8 sets**

      Replace the T24 Battery Charger-DC.

    - **If DTC P0AF8 does not set**
11. Verify that DTC P0AF8 does not set while operating the vehicle within the Conditions for Running the DTC.

  - **If DTC P0AF8 sets**

    Replace the A28 Hybrid/EV Battery Contactor Assembly.

  - **If DTC P0AF8 does not set**

12. All OK.

Battery Main Bus Diagnostics

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module, A4 Hybrid/EV Battery Pack and T24 Battery Charger-DC. Refer to **High Voltage Disabling**.
2. Disconnect the X3 harness connector at the A4 Hybrid/EV Battery Pack.
3. Disconnect the X2 high voltage connector at the T6 power inverter module.
4. Disconnect the X1 and X3 connectors at the T24 Battery Charger-DC.
5. Test for infinite resistance between the High voltage DC (+360 V) positive terminal A and the high voltage DC (-360 V) negative terminal B X3 connector at the A4 Hybrid/EV Battery Pack, harness side.
   - **If less than infinite resistance**

     Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

   - **If infinite resistance**
6. Test for infinite resistance between the High voltage DC (+360 V) positive terminal A and the high voltage DC (-360 V) negative terminal B X2 connector at the T6 Power Inverter Module, harness side.
   - **If less than infinite resistance**

     Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

   - **If infinite resistance**
7. Test for infinite resistance between the High voltage DC (+360 V) positive terminal A and the high voltage DC (-360 V) negative terminal B X1 connector at the T24 Battery Charger - DC, module side.
   - **If less than infinite resistance**

     Replace the T24 Battery Charger-DC. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

   - **If infinite resistance**
8. Test for less than 10 Ω between the terminals listed below:
   - High voltage DC (-360 V) negative terminal B X3 harness connector at the A4 Hybrid/EV Battery Pack and the high voltage DC (-360 V) negative terminal B X3 harness connector at the T24 Battery Charger-DC.
   - High voltage DC (+360 V) positive terminal A X3 harness connector at the A4 Hybrid/EV Battery Pack and the high voltage DC (+360 V) negative terminal A X3 harness connector at the T24 Battery Charger-DC.
   - **If 10 Ω or greater**

     Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

   - **If less than 10 Ω**
9. Test for less than 10 Ω between the terminals listed below:
   - High voltage DC (-360 V) negative terminal B X2 harness connector at the T6 Power Inverter Module and the high voltage DC (-360 V) negative terminal B X1 harness connector at the T24 Battery Charger-DC.
   - High voltage DC (+360 V) positive terminal A X2 harness connector at the T6 Power Inverter Module and the high voltage DC (+360 V) negative terminal A X1 harness connector at the T24 Battery Charger-DC.
   - **If 10 Ω or greater**

     Replace the high voltage DC cables. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

   - **If less than 10 Ω**
10. Test for less than 10 Ω between the terminals listed below:

- High voltage DC (-360 V) negative terminal B X3 module connector at the T24 Battery Charger-DC and the high voltage DC (-360 V) negative terminal B X1 module connector at the T24 Battery Charger-DC.
- High voltage DC (+360 V) positive terminal A X3 module connector at the T24 Battery Charger-DC and the high voltage DC (+360 V) negative terminal A X1 module connector at the T24 Battery Charger-DC.
- **If 10 Ω or greater**

  Replace the T24 Battery Charger-DC. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

- **If less than 10 Ω**

11. Replace the T6 Power Inverter Module.
12. Verify that DTC P0AF8 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If DTC P0AF8 sets**

      Replace the A28 Hybrid/EV Battery Contactor Assembly.

    - **If DTC P0AF8 does not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **300-Volt Battery Positive and Negative Cable Replacement (Generator Battery Control Wiring Junction Block to Drive Motor Battery)**
- Refer to **Drive Motor Battery Charger Replacement (Except Dubai)** **Drive Motor Battery Charger Replacement (Dubai)** for T18 Battery Charger replacement.
- Refer to **Accessory DC Power Control Module Replacement** for K1 14 V Power Module replacement.
- Refer to **High Voltage Battery Disconnect Relay Fuse Replacement** for T18 battery charger fuse replacement.
- Refer to **High Voltage Battery Control Wiring Junction Block Replacement (With quick charge)** **High Voltage Battery Control Wiring Junction Block Replacement (Without quick charge)** for T24 Battery Charger-DC replacement.
- Refer to **High Voltage Battery Disconnect Relay Replacement** for A28 hybrid/EV battery contactor assembly replacement.
- Refer to **Control Module References** for T6 power inverter module replacement, programming and setup.

DTC P0AFA OR P0AFB: HYBRID/EV BATTERY SYSTEM VOLTAGE LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0AFA

Hybrid/EV Battery System Voltage Low Voltage

DTC P0AFB

Hybrid/EV Battery System Voltage High Voltage

Circuit/System Description

The high voltage hybrid/EV battery contains 288 individual cells. Three cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid/EV battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.65 V, for a nominal system voltage of 350 V direct current. The battery cell groups are electrically joined to form 10 distinct electrical modules.

Located within the high voltage Hybrid/EV battery pack, the K16 battery energy control module monitors the temperature, current and voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the end of the battery cell module. A voltage sense harness joins this connector to the K16 battery energy control module.

Conditions for Running the DTC

- The battery energy control module is awake and communicating.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, U0111, U185A.

Conditions for Setting the DTC

P0AFA

The Hybrid Battery Pack Voltage is less than 168.1 V when at temperatures of 9Â°C (48Â°F) or less.

OR

The Hybrid Battery Pack Voltage is less than 174.5 V when temperatures of greater than 9Â°C (48Â°F).

P0AFB

The Hybrid Battery Pack Voltage is greater than 438 V when at temperatures of 19Â°C (66Â°F).

OR

The Hybrid Battery Pack Voltage is greater than 441 V when at temperatures of greater than 19Â°C (66Â°F).

Action Taken When the DTC Sets

DTCs P0AFA and P0AFB are type A DTCs.

DTC P0AFB

Once the vehicle has been turned OFF, the hybrid/EV powertrain control module 2 will not CLOSE the high voltage contactors until the DTC has been cleared.

Conditions for Clearing the DTC

- DTCs P0AFA and P0AFB are type A DTCs.
- The Clear Secured High Voltage DTCs reset function must be performed with a scan tool before clear codes.

Diagnostic Aids

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

The hybrid/EV battery pack high voltage manual service disconnect is not installed correctly, or a blown manual service disconnect fuse will cause P0AFA to set.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0B3B, P0B3C, P0B3D, P0B3E, P0B40, P0B41, P0B42, P0B43, P0B45, P0B46, P0B47, P0B48, P0B4A, P0B4B, P0B4D, P0B4C, P0B4F, P0B50, P0B51, P0B52, P0B54, P0B55, P0B56, P0B57, P0B59, P0B5A, P0B5B, P0B5C, P0B5E, P0B60, P0B5F, P0B61, P0B63, P0B64, P0B65, P0B66, P0B69, P0B68, P0B6A, P0B6D, P0B6B, P0B6E, P0B70, P0B6F, P0B72, P0B74, P0B73, P0B75, P0B77, P0B78, P0B79, P0B7A, P0B7D, P0B7C, P0B7E, P0B7F, P0B81, P0B82, P0B83, P0B84, P0B86, P0B87, P0B88, P0B89, P0B8B, P0B8C, P0B8D, P0B8E, P0B90, P0B91, P0B92, P0B93, P0B95, P0B96, P0B97, P0B98, P0B9A, P0B9B, P0B9C, P0B9D, P0B9F, P0BA1, P0BA0, P0BA2, P0BA4, P0BA5, P0BA6, P0BA7, P0BA9, P0BAA, P0BAB, P0BAC, P0BAE, P0BAF, P0BB0, P0BB1, P0BB3, P0BB4, P0BB5, P0BB6, P0BB8, P0BB9, P0BBA, P0BBB, P0D0A, P0D11, P1B16, P1B17, P1B18, P1B19, P1B1A, P1B1B, P1B1C, P1B1D, P1B1E, P1B1F, P1B20, P1B21, P1B22, P1B23, P1B24, P1B25, P1B26, P1B27, P1B28, P1B29, P1B2B, P1B2A, P1B2C, P1B2D, P1B45, P1B46, P1B47, P1B48, P1B49, P1B4A, P1B4B, P1B4C, P1B4D, P1B4E, P1B4F, P1B50, P1B51, P1B52, P1B53, P1B54, P1B55, P1B56, P1B57, P1B58, P1B59, P1B5A, P1B5B, P1B5C, P1B5D, P1B5E, P1B5F, P1B60, P1B61, P1B62, P1B63, P1B64, P1B65, P1B66, P1B67, P1B68, P1B69, P1B6A, P1B6B, P1B6C, P1B6D, P1B6E, P1B6F, P1B70, P1B71, P1B72, P1B73, P1B74, P1B75, P1B76, P1B77, P1B78, P1B79, P1B7A, P1B7B, P1B7C, P1B7D, P1B7F, P1B7E, P1B80, P1B81, P1B82, P1B83, P1B84, P1B85, P1B86, P1B87, P1B88, P1B89, P1B8A, P1B8B, P1B8C, P1B8D, P1B8E, P1B8F, P1B90, P1B91, P1B92, P1B93, P1B94, P1B95, P1B97, P1B96, P1B98, P1B99, P1B9A, P1B9B, P1B9C, P1B9D, P1B9E, P1B9F, P1BA0, P1BA1, P1BA2, P1BA3, P1BA4, P1BA5, P1BA6, P1BA7, P1BA8, P1BA9, P1BAB, P1BAA, P1BAC, P1BAD, P1BAE, P1BAF, P1BB0, P1BB1, P1BB2, P1BB3, P1BB4, P1BB5, P1BB6, P1BB7, P1BB8, P1BB9, P1BBA, P1BBB, P1BBC, P1BBD, P1BBE, P1BBF, P1BC0, P1BC1, P1BC2, P1BC3, P1BC4, P1BC5, P1BC6, P1BC7, P1BC8, P1BC9, P1BCA, P1BCB, P1BCC, P1BCE, P1BCD, P1BCF, P1BD0, P1BD2, P1BD1, P1BD3, P1BD4, P1BD5, P1BD6, P1BD7, P1BD8, P1BD9, P1BDA, P1BDB, P1BDD, P1BDC, P1BDE, P1BDF, P1BE1, P1BE0, P1BE3, P1BE2, P1BE4, P1BE5, P1BE6, P1BE7, P1BE8, P1BE9, P1BEA, P1BEB, P1BEC, P1BED, P1BEE, P1BF0, P1BEF, P1BF1, P1BF2, P1BF4, P1BF3, P1BF5, P1BF4, P1BF7, P1BF8, P1BF9, P1BFA, P1BFB, P1BFC, P1BFD, P1BFE, P1E01, P1E02, P1E03, P1E04, P1E05, P1E06, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E62, P1E61, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6D, P1E6C, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E76, P1E75, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, P1EBC, P1EBF, P1EC0, P1EC3, P1EC4, P1EC5, U2603, U2604, U2605, U2606, or U2401 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If none of the DTCs are set**
3. Verify the scan tool Hybrid/EV Battery Pack Terminal 1 Voltage is between 168.1 - 441 V.
    - **If not within the specified range**

      Refer to Circuit/System Testing, Hybrid Battery Pack Voltage Diagnosis.

- **If within the specified range**

4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**
2. Remove the S15 manual service disconnect.
3. Test for less than 10 Ω across the S15 manual service disconnect fuse terminals.
   - **If 10 Ω or greater**

     Replace the S15 manual service disconnect and repeat Circuit/System Verification.

   - **If less than 10 Ω**
4. Remove the A4 hybrid/EV battery pack cover. Refer to **Battery Upper Cover Replacement** .
5. Install a known good S15 manual service disconnect.

   WARNING: **High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.**

   NOTE: **You are testing high voltage.**

6. Test for 168 - 441 V between the negative (300 V) C5A and positive (300 V) C5K at the A28 Hybrid/EV Battery Contactor Assembly.
   - **If not within the specified range**

     Replace the A4 Hybrid/EV Battery Pack. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

   - **If within the specified range**
7. Replace the K16 Battery Energy Control Module. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions. After the repair is complete with a scan tool, the **Clear Secured High Voltage DTCs** reset function must be performed.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)**
- Refer to **Control Module References** for K16 battery energy control module replacement, programming and setup.

DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06, OR P1E4C-P1E8B: HYBRID/EV BATTERY 1-96 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Hybrid/EV Battery 96 Circuit

Circuit/System Description

The high voltage hybrid/EV battery contains 288 individual cells. Three cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid/EV battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.65 V, for a nominal system voltage of 350 V direct current. The battery cell groups are electrically joined to form 10 distinct electrical modules.

Located within the high voltage Hybrid/EV battery pack, the K16 battery energy control module monitors the temperature, current and voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the end of the battery cell module. A voltage sense harness joins this connector to the K16 battery energy control module.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at connectors located on the end of the battery module. A voltage sense harness joins these connectors to the battery energy control module.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

Hybrid/EV Battery Circuit Open DTCs

- Vehicle ON.
- The hybrid/EV battery energy control module is awake and communicating.
- None of the following DTCs are set; U0111 or U185A.

Hybrid/EV Battery Circuit Performance, Hybrid/EV Battery Circuit Low Voltage and Hybrid/EV Battery Circuit High Voltage DTCs:

- Vehicle ON.
- The hybrid/EV battery energy control module is awake and communicating.
- None of the following DTCs are set: P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B72, P0B77, P0B7C, P0B81, P0B86, P0B8B, P0B90, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6D, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, P1E8B, P1F86, P1F87, P1F88, P1F89, P1F8A, P1F8B, P1F8C, P1F8D, P1F8E, P1F8F, P1F90, P1F91, P1F92, P1F93, P1F94, P1F95, U0111, or U185A

Conditions for Setting the DTC

P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, P1E8B are Type A DTCs.
- The hybrid/EV battery energy control module detects high resistance on the circuit.

Circuit Performance

- P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B19, P1B1F, P1B25, P1B45, P1B48, P1B4B, P1B4E, P1B51, P1B54, P1B57, P1B5A, P1B5D, P1B60, P1B63, P1B66, P1B69, P1B6C, P1B6F, P1B72, P1B75, P1B78, P1B7B, P1B7E, P1B81, P1B84, P1B87, P1B8A, P1B8D, P1B90, P1B93, P1B96, P1B99, P1B9C, P1B9F, P1BA2, P1BA5, P1BA8, P1BAB, P1BAE, P1BB1, P1BB4, P1BB7, P1BBA, P1BBD, P1BC0, P1BC3, P1BC6, P1BC9, P1BCC, P1BCF, P1BD2, P1BD5, P1BD8, P1BDB, P1BDE, P1BE1, P1BE4, P1BE7, P1BEA, P1BED, P1BF0, P1BF3, P1BF6, P1BF9, P1BFC, P1E01, P1E04 are Type A DTCs.
- The faulted cell group does not change voltage.

Low Voltage

- P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P1B46, P1B4C, P1B4F, P1B52, P1B55, P1B58, P1B5B, P1B5E, P1B61, P1B64, P1B67, P1B6A, P1B6D, P1B70, P1B73, P1B76, P1B79, P1B7C, P1B7F, P1B82, P1B85, P1B88, P1B8B, P1B8E, P1B91, P1B94, P1B97, P1B9A, P1B9D, P1BA0, P1BA3, P1BA6, P1BA9, P1BAC, P1BAF, P1BB2, P1BB5, P1BB8, P1BBB, P1BBE, P1BC1, P1BC4, P1BC7, P1BCA, P1BCD, P1BD0, P1BD3, P1BD6, P1BD9, P1BDC, P1BDF, P1BE2, P1BE5, P1BE8, P1BEB, P1BEE, P1BF1, P1BF4, P1BF7, P1BFA, P1BFD, P1E02, P1E05 are Type A DTCs.
- Any hybrid/EV battery voltage signal is less than 1.75 V.

High Voltage

- P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27, P1B47, P1B4A, P1B4D, P1B50, P1B53, P1B56, P1B59, P1B5C, P1B5F, P1B62, P1B65, P1B68, P1B6B, P1B6E, P1B71, P1B74, P1B77, P1B7A, P1B7D, P1B80, P1B83, P1B86, P1B89, P1B8C, P1B8F, P1B92, P1B95, P1B98, P1B9B, P1B9E, P1BA1, P1BA4, P1BA7, P1BAA, P1BAD, P1BB0, P1BB3, P1BB6, P1BB9, P1BBC, P1BBF, P1BC2, P1BC5, P1BC8, P1BCB, P1BCE, P1BD1, P1BD4, P1BD7, P1BDA, P1BDD, P1BE0, P1BE3, P1BE6, P1BE6, P1BE9, P1BEC, P1BEF, P1BF2, P1BF5, P1BF8, P1BFB, P1BFE, P1E03, P1E06 are Type A DTCs.
- Any hybrid/EV battery voltage signal is greater than 4.58 V.

Action Taken When the DTC Sets

- DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06 or P1E4C-P1E8B are type A DTCs.
- If any performance DTCs are set, the vehicle will operate in a reduced power mode.
- Battery Circuit, Low Voltage or High Voltage DTCs set: Once the vehicle has been turned OFF, the hybrid/EV powertrain control module 2 will not CLOSE the high voltage contactors until the DTC has been cleared.

Conditions for Clearing the DTC

- DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06 or P1E4C-P1E8B are type A DTCs.
- Battery Circuit, Low Voltage or High Voltage DTCs set: The **Clear Secured High Voltage DTCs** reset function must be performed with a scan tool before clear codes.

Diagnostic Aids

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**

3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group and corresponding DTC.

- **EL-48900** HEV Safety Kit

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Hybrid/EV Battery 1 - 96 voltages are between 3.28-4.16 V and all readings are within 0.03 V of each other.
   - **If not between 3.28-4.16 V or not within 0.03 V of each other**

     Refer to Circuit/System Testing.

   - **If between 3.28-4.16 V and within 0.03 V of each other**
3. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable high voltage at the A4 hybrid/EV battery pack. Refer to **High Voltage Disabling**
2. Remove the A4 hybrid/EV battery pack cover. Refer to **Battery Upper Cover Replacement** .

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

3. Disconnect all K16 battery energy control module connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
4. Inspect the harness connectors and the K16 battery energy control module connectors for corrosion.
   - **If corrosion is present**

     Replace the Hybrid/EV Battery Pack Internal Harness and the K16 Battery Energy Control Module as applicable.

   - **If corrosion is not present**

NOTE: **The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group and corresponding DTC.**

5. Disconnect the harness connectors at the appropriate C5 Hybrid/EV Battery Module as indicated by the voltages observed during Circuit/System Verification.
6. Inspect the harness connectors and the C5 Hybrid/EV Battery Module connectors for corrosion.
   - **If corrosion is present**

     Replace the Hybrid/EV Battery Pack Internal Harness and the C4 Hybrid/EV Battery Section, as applicable.

   - **If corrosion is not present**
7. Connect the **EL-48571** High Voltage Battery Pin Out Box with the **EL-48571-61** , **EL-48571-62** , or **EL-48571-63** adapter to the battery module. Refer to **EL-48571 High Voltage Battery Pin Out Box Reference** for proper X1, X2 orientation.
8. Insert the DMM probes into the **EL-48571** test cavities.
9. Measure and record the voltage of each of the cell groups by cycling the **EL-48571** through each of the switch positions. Refer to **EL-48571 High Voltage Battery Pin Out Box Reference**

10. Verify each cell group voltage reading is between 3.28-4.16 V.
    - **If not within the specified range**

      Replace the appropriate C4 Hybrid/EV Battery Section.

    - **If within the specified range**
11. Verify each cell group voltage reading is within 0.03 V of each other.
    - **If greater than 0.03 V**

      Replace the appropriate C4 Hybrid/EV Battery Section.

    - **If 0.03 V or less**

NOTE: **Perform the following testing at the hybrid/EV battery pack internal wiring harness connector.**

12. Test for infinite resistance between each appropriate voltage sense circuit terminals and ground.
    - **If less than infinite resistance**

      Replace the Hybrid/EV Battery Pack Internal Harness.

    - **If infinite resistance**
13. Test for less than 2 Ω in each appropriate voltage sense circuits end to end.
    - **If 2 Ω or greater**

      Replace the Hybrid/EV Battery Pack Internal Harness.

    - **If less than 2 Ω**
14. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Cell Battery Module Replacement (Row 1)** **Cell Battery Module Replacement (Row 2)** **Cell Battery Module Replacement (Row 3)** **Cell Battery Module Replacement (Row 4)** **Cell Battery Module Replacement (Row 5)** for C4 hybrid/EV battery section replacement
- Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)**
- Refer to **Drive Motor Battery Sensor Module Wiring Harness Replacement (Left)** **Drive Motor Battery Sensor Module Wiring Harness Replacement (Right)** **Drive Motor Battery Sensor Module Wiring Harness Replacement (LH, Sub)** **Drive Motor Battery Sensor Module Wiring Harness Replacement (RH, Sub)** for hybrid/EV battery pack internal harness replacement
- Refer to **Control Module References** for K16 hybrid/EV battery energy control module replacement, programming and setup.

DTC P0C78 OR P3061: HYBRID/EV BATTERY PRECHARGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0C78

Hybrid/EV Battery System Precharge Time Too Long

DTC P3061

Hybrid/EV Battery Precharge High Current

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor and a precharge negative high voltage contactor. The contactors close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage contactors. Ground is provided through the case ground.

In order to prevent large in-rush current, system bus high voltage is routed through a pre-charge resistor whenever high voltage is commanded ON. The hybrid/EV powertrain control module 2 monitors the time and current it takes the system bus voltage to attain the same level as the battery pack voltage. If it takes too long, or too much current flows, a DTC is set.

Conditions for Running the DTC

P0C78

- Battery voltage sensor has not failed.
- Bus voltage sensor has not failed.
- Contactor status is Precharging.
- Cabin heating is Off.

P3061

- Battery voltage sensor has not failed.
- Battery current sensor has not failed.
- Precharge is active.

Conditions for Setting the DTC

P0C78

The bus voltage has not reached 95% of battery voltage or is greater than 105% within 700 ms of the contactors closing.

P3061

The bus current is greater than 3 amps for 88 ms during precharge.

Actions Taken When the DTC Sets

- DTC P0C78 and P3061 are type A DTCs.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

DTC P0C78 and P3061 are type A DTCs.

Circuit/System Verification

1. Record the freeze frame/failure records.
2. Vehicle in Service Mode.
3. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D0A, or P1EC3 is not set.
    - **If any of the DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle

    - **If none of the DTCs are set**

NOTE: **The following setup steps must be performed exactly in order to exercise the contactors.**

4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. OPEN the driver door using outside door handle. Leave driver door OPEN.

NOTE: **The parking lamps must remain ON throughout the remainder of the contactor steps.**

6. Turn ON the parking lamps.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode.**

7. Command the Hybrid/EV Battery Contactors ALL OPEN with a scan tool.
8. Disconnect the S15 Manual Service Disconnect.

NOTE: **DO NOT use the Release Control button to turn OFF any of the contactors. Once the Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning.**

9. Command the Hybrid/EV Battery Negative Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
10. Verify the Hybrid/EV Battery Negative Contactor should be heard closing and opening.
    - **If the Hybrid/EV Battery Negative Contactor does not open and close**

      Refer to Circuit/System Testing, Contactor Function Diagnosis.

    - **If the Hybrid/EV Battery Negative Contactor does open and close**
11. Command the Hybrid/EV Battery Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
12. Verify the Hybrid/EV Battery Positive Contactor should be heard closing and opening.
    - **If the Hybrid/EV Battery Positive Contactor does not open and close**

      Refer to Circuit/System Testing, Contactor Function Diagnosis.

    - **If the Hybrid/EV Battery Positive Contactor does open and close**
13. Command the Hybrid/EV Battery Precharge Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
14. Verify the Hybrid/EV Battery Precharge Contactor should be heard opening and closing.
    - **If the Hybrid/EV Battery Precharge Contactor does not open and close**

Refer to Circuit/System Testing, Contactor Function Diagnosis.

- **If the Hybrid/EV Battery Precharge Contactor does open and close**

15. Command the Hybrid/EV Battery Charger Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
16. Verify the Hybrid/EV Battery Charger Contactor should be heard opening and closing.
    - **If the Hybrid/EV Battery Charger Contactor does not open and close**

      Refer to Circuit/System Testing, Contactor Function Diagnosis.

    - **If the Hybrid/EV Battery Charger Contactor does open and close**
17. Test for less than 10 Ω across the S15 manual service disconnect fuse terminals.
    - **If 10 Ω or greater**

      Obtain a new S15 manual service disconnect and Refer to Circuit/System Testing, High Voltage System Bus Diagnosis without DTC P0D26.

    - **If less than 10 Ω**
18. Vehicle OFF.
19. Install the S15 Manual Service Disconnect.
20. Clear the DTC information. Vehicle OFF and wait 5 minutes. Vehicle ON, verify DTC P0C78 or P3061 do not set.
    - **If any of the DTCs are set**

      NOTE: The vehicle must remain OFF to prevent DTC P0C78 from running.

      1. Vehicle OFF. Wait 5 minutes.
      2. Connect the drive motor battery charger cable.
      3. Verify DTC P0D26 is not set and the vehicle will charge.
         - If the DTC is set and the vehicle will not charge, Refer to Circuit/System Testing, High Voltage System Bus Diagnosis with DTC P0D26.
         - If the DTC is not set and the vehicle charges, Refer to Circuit/System Testing, High Voltage System Bus Diagnosis without DTC P0D26.
    - **If none of the DTCs are set**
21. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

Contactor Function Diagnosis

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
3. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
   - **If greater than 10 Ω**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
5. Verify that a test lamp illuminates between the A4 Hybrid/EV Battery Pack harness B+ circuit terminal 1 X357 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K16 Battery Energy Control Module and hybrid/EV battery pack internal wiring harness.
   - **If the test lamp illuminates**
6. Vehicle in Service Mode.
7. Verify that a test lamp does not illuminate between each A4 Hybrid/EV Battery Pack harness connector control circuit terminals listed below and ground:
   - Terminal 3 X358
   - Terminal 4 X358
   - Terminal 5 X358
   - Terminal 7 X358
   - **If the test lamp illuminates on any circuit**
   1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.
   - **If the test lamp does not illuminate on all circuits**
8. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.
9. Test for infinite resistance between each A4 Hybrid/EV Battery Pack harness connector control circuit terminals listed below and ground:
   - Terminal 3 X358
   - Terminal 4 X358
   - Terminal 5 X358
   - Terminal 7 X358
   - **If less than infinite resistance on either circuit**

     Repair the short to ground on the circuit.

   - **If infinite resistance on both circuits**
10. Test for less than 2 Ω between the harness connector terminals listed below:
    - Terminal 3 X358 at the A4 Hybrid/EV Battery Pack and terminal 9 X1 at the K114B Hybrid Powertrain Control Module 2

- Terminal 4 X358 at the A4 Hybrid/EV Battery Pack and terminal 6 X1 at the K114B Hybrid Powertrain Control Module 2
- Terminal 7 X358 at the A4 Hybrid/EV Battery Pack and terminal 8 X1 at the K114B Hybrid Powertrain Control Module 2
- Terminal 5 X358 at the A4 Hybrid/EV Battery Pack and terminal 3 X1 at the K114B Hybrid Powertrain Control Module 2
- **If 2 Ω or greater on any circuit**

  Repair the open/high resistance in the circuit.

- **If less than 2 Ω on all circuits**

11. Replace the A28 Hybrid/EV Battery Contactor Assembly.
12. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If DTC P0C78 or P3061 sets**

      Replace the K114B Hybrid Powertrain Control Module 2.

    - **If DTC P0C78 or P3061 does not set**
13. All OK.

High Voltage System Bus Diagnosis with DTC P0D26

1. Disable the high voltage for servicing at the A4 Battery Pack, K1 14V Power Module and the T18 Battery Charger. Refer to High Voltage Disabling.
2. Disconnect the X3 connector at the T18 Battery Charger and the X1 connector at the K1 14V Power Module.
3. Verify that all HV harness connector and mating module connector terminals are free from moisture, corrosion and arc flash damage.
   - **If any terminals show signs of damage**

     Replace the HV wiring harness and effected modules as necessary.

   - **If no arc flash damage, moisture, or corrosion is found**

NOTE: **This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.**

4. Test the K1 14 V Power Module X1 terminals for greater than 10K Ω, X1-A to X1-B.
   - **If 10K Ω or less**
   1. Replace the K1 14V Power Module.
   2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
      - If DTC P0C78 or P03061 sets

        Replace the A28 Hybrid/EV Battery Contactor Assembly.

      - If DTC P0C78 or P03061 does not set
   3. All OK.
   - **If greater than 10K Ω**

NOTE: **This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.**

5. Test the T18 Battery Charger terminals for greater than 10K Ω, X3-1 to X3-2.
   - **If 10K Ω or less**
   1. Replace the T18 Battery Charger.

    2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
        - If DTC P0C78 or P03061 sets

          Replace the A28 Hybrid/EV Battery Contactor Assembly.

        - If DTC P0C78 or P03061 does not set
    3. All OK.
  - **If greater than 10K Ω**
6. Remove and open the A4 Battery Pack. Refer to **Battery Upper Cover Replacement** .
7. Inspect the High Voltage bus bars for loose/damaged terminal fasteners.
   - **If a terminal concern is found**

     Replace all affected components.

   - **If no internal concerns are observed**
8. Replace the A28 Hybrid/EV Battery Contactor Assembly.
9. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
   - **If DTC P0C78 or P3061 sets**

     Replace the K114B Hybrid Powertrain Control Module 2.

   - **If DTC P0C78 or P3061 does not set**
10. All OK.

High Voltage System Bus Diagnosis without DTC P0D26

1. Disable the high voltage for servicing at the A4 Battery Pack, G1 A/C Compressor, T6 Power Inverter Module, T24 Battery Charger and the K10 Coolant Heater. Refer to **High Voltage Disabling**.
2. Disconnect the X2 connector at the T6 Power Inverter Module, the X1 and X3 connectors at the T24 Battery Charger and the X3 connector at the A4 Battery Pack.
3. Verify that all HV harness connector and mating module connector terminals are free from moisture, corrosion and arc flash damage.
   - **If any terminals show signs of damage**

     Replace the HV wiring harness and effected modules as necessary.

   - **If no arc flash damage, moisture, or corrosion is found**

NOTE: **This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.**

4. Test the T6 Power Inverter Module X2 terminals for greater than 10K Ω, X2-A to X2-B.
   - **If 10K Ω or less**
     1. Replace the T6 Power Inverter Module.
     2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
        - If DTC P0C78 or P03061 sets

          Replace the A28 Hybrid/EV Battery Contactor Assembly.

        - If DTC P0C78 or P03061 does not set
     3. All OK.
   - **If greater than 10K Ω**

NOTE: **This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.**

5. Test the K10 Coolant Heater X1 terminals for greater than 10K Ω, X1-1 to X1-2.
    - **If 10K Ω or less**
    1. Replace the K10 Coolant Heater Control Module.
    2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
        - If DTC P0C78 or P03061 sets

          Replace the A28 Hybrid/EV Battery Contactor Assembly.

        - If DTC P0C78 or P03061 does not set
    3. All OK.
    - **If greater than 10K Ω**

NOTE: **This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.**

6. Test the G1 A/C Compressor X2 terminals for greater than 10K Ω, X2-A to X2-B.
    - **If 10K Ω or less**
    1. Replace the G1 A/C Compressor.
    2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
        - If DTC P0C78 or P03061 sets

          Replace the A28 Hybrid/EV Battery Contactor Assembly.

        - If DTC P0C78 or P03061 does not set
    3. All OK.
    - **If greater than 10K Ω**
7. Test the following T24 Battery Charger terminals for less than 2 Ω, terminal to terminal:
    - X1-A to X3-A
    - X1-B to X3-B
    - **If 2 Ω or greater**

      Replace the T24 Battery Charger.

    - **If less than 2 Ω**
8. Remove and open the A4 Battery Pack. Refer to Battery Upper Cover Replacement .
9. Inspect the High Voltage bus bars for loose/damaged terminal fasteners.
    - **If a terminal concern is found**

      Replace all affected components.

    - **If no internal concerns are observed**
10. Replace the A28 Hybrid/EV Battery Contactor Assembly and the K16 Battery Energy Control Module.
11. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If DTC P0C78 or P3061 sets**

      Replace the K114B Hybrid Powertrain Control Module 2.

    - **If DTC P0C78 or P3061 does not set**
12. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to High Voltage Battery Control Wiring Junction Block Replacement (With quick charge) High Voltage Battery Control Wiring Junction Block Replacement (Without quick charge) for T24 battery charger replacement

- Refer to **Air Conditioning and Drive Motor Battery Cooling Compressor Replacement** for G1 A/C compressor replacement
- Refer to **Heater Coolant Heater Replacement** for K10 coolant heater replacement
- Refer to **High Voltage Battery Disconnect Relay Replacement** for A28 Hybrid/EV Battery Contactor Assembly
- Refer to **Control Module References** for K16 battery energy control module, T6 power inverter module, K1 14V power module, or K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P3040

Hybrid/EV Battery Interface Control Module 12 5 V Reference Circuit

Circuit/System Description

The hybrid battery contains 288 individual cells. Three cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid battery assembly.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at connectors located on the end of each battery module. A voltage sense harness joins these connectors to the battery energy control module.

The battery energy control module contains internal interface control modules that monitor specific cell groups.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

P1A07

- The battery energy control module is awake and communicating.
- The 12 V battery voltage greater than or equal to 9 V.

P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, and P3040

- The battery energy control module is awake and communicating.
- None of the following DTCs are set; U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, U2624

Conditions for Setting the DTC

P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, and P3040

The battery energy control module has detected an internal 5V reference circuit voltage is less than 2.8 V or greater than 3.2 V.

Actions Taken When the DTC Sets

- DTCs P1A07 P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, and P3040 are Type A DTCs.
- The vehicle will operate in a reduced power mode.

Conditions for Clearing the DTC

DTCs P1A07 P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, and P3040 are Type A DTCs.

Circuit/System Verification

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify that DTC P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, or P3040 is not set.
   - **If DTC P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, or P3040 is set**
   1. Disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
   2. Replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
   - **If none of the DTCs are set**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K16 battery energy control module programming and setup.

DTC P1B3F OR P1B40: HIGH VOLTAGE SYSTEM INTERLOCK CIRCUIT 2 LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1B3F

High Voltage System Interlock Circuit 2 Low Voltage

DTC P1B40

High Voltage System Interlock Circuit 2 High Voltage

Circuit/System Description

A high voltage interlock circuit is used to determine if access to high voltage components or connectors is being attempted. The opening of these high voltage components causes the high voltage interlock circuit to open. The hybrid/EV powertrain control module 2 sources about 5 V on the high voltage interlock circuit loop. When the hybrid/EV powertrain control module 2 detects a loss of high voltage interlock circuit current, the high voltage contactors are commanded open.

The T6 Power Inverter Module and the T24 Battery Charger Module - DC each contain 35 - 45 Ω resistors in order to detect attempted bypassing of the high voltage interlock circuit.

The high voltage interlock circuit 2 monitors for integrity of the following components:

- T24 Battery Charger - DC high voltage connectors - CBT only*:
  - X1
  - X2

    - X3
- T6 Power Inverter Module high voltage DC harness connector

*w/o CBT the high voltage interlock circuit 2 connects to the T24 Battery Charger - DC but does not monitor any high voltage connectors.

Conditions for Running the DTC

P1B3F

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV powertrain control module 2 is commanding 5 V on the high voltage interlock circuit.

P1B40

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV powertrain control module 2 is commanding 0 V on the high voltage interlock signal circuit.

  OR

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV powertrain control module 2 is commanding 5 V on the high voltage interlock signal circuit.

Conditions for Setting the DTC

P1B3F

The hybrid/EV powertrain control module 2 detects high voltage interlock circuit 5 V low reference voltage is less than 24% of the commanded 5 V signal voltage.

P1B40

- The hybrid/EV powertrain control module 2 detects high voltage interlock circuit 5 V low reference voltage is greater than 24% of the commanded 0 V signal voltage.

  OR

- The hybrid/EV powertrain control module 2 detects high voltage interlock circuit 5 V low reference voltage is greater than 44% of the commanded 5 V signal voltage.

Action Taken When the DTC Sets

- DTCs P1B3F and P1B40 are Type A DTCs.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors when vehicle speed is less than 5 km/h (3 mph).

Conditions for Clearing the DTC

DTCs P1B3F and P1B40 are Type A DTCs.

Diagnostic Aids

With all monitored high voltage components engaged and the Battery Charging System High Voltage Interlock Circuit is energized, observe the scan tool hybrid/EV powertrain control module 2 Battery Charging System High Voltage Interlock Circuit Status parameter for a PASS status. To help identify intermittent conditions, manipulate the monitored components and inline connectors. An open interlock circuit will display a FAIL status.

Circuit/System Verification

1. Verify all monitored high voltage components and connectors are connected.
2. Vehicle in Service Mode.
3. Observe the hybrid/EV powertrain control module 2 Battery Charging System High Voltage Interlock Circuit Status parameter. Verify the parameter indicates a PASS condition.
   - **The parameter indicates a FAIL condition**

     Refer to Circuit/System Testing.

   - **The parameter indicates a PASS condition**
4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable high voltage at the T24 Battery Charger - DC and the T6 Power Inverter Module. Refer to **High Voltage Disabling** procedure.

2. Verify the vehicle is not equipped with RPO CBT.
   - **If the vehicle is equipped with RPO CBT**
     1. Disconnect T24 Battery Charger-DC high voltage connectors X1, X2 and X3, if not already removed during the High Voltage Disabling procedure. Verify that the high voltage interlock circuit terminals at each high voltage connector - harness side are not bent or broken and are OK.
        - If not OK, replace the applicable high voltage harness.
        - If OK
     2. Test for less than 10 Ω between the high voltage interlock circuit terminals at each high voltage connector - harness side.
        - If 10 Ω or greater, replace the applicable high voltage harness.
        - If less than 10 Ω
     3. Reconnect the T24 Battery Charger high voltage connector X1, X2 and X3 and continue.
   - **If the vehicle is NOT equipped with RPO CBT or steps 2.1 - 2.3 have passed**
3. Disconnect the T24 Battery Charger-DC connector X9.
4. Test for 35 - 45 Ω between the 5 V signal circuit terminal 7 and the low reference circuit terminal 12 at T24 Battery Charger-DC connector X9, module side.
   - **If not within the specified range**

     Replace the T24 Battery Charger-DC.

   - **If within the specified range**
5. Test for infinite resistance between each of the terminals listed below and ground:
   - Terminal 7, module side
   - Terminal 12, module side
   - **If less than infinite resistance**

     Replace the T24 Battery Charger-DC.

   - **If infinite resistance**
6. Disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
7. Test for less than 10 Ω between the 5 V signal circuit terminal 67 at the K114B Hybrid/EV Powertrain Control Module 2 connector X1 and T24 Battery Charger-DC X9 terminal 7.
   - **If 10 Ω or greater**

     Repair the open/high resistance in the circuit.

   - **If less than 10 Ω**
8. Test for infinite resistance between K114B Hybrid/EV Powertrain Control Module 2 harness connector X1 terminal 67 and ground.
   - **If less than infinite resistance**

     Repair the short to ground on the circuit.

   - **If infinite resistance**
9. Disconnect T6 Power Inverter Module connector X1.
10. Test for less than 10 Ω between the 5 V signal circuit terminal 12 at the T24 Battery Charger-DC and terminal G2 at the T6 Power Inverter Module connector X1.
    - **If 10 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 10 Ω**
11. Test for infinite resistance between the 5 V signal circuit terminal 12 at the T24 Battery Charger-DC and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
12. Test for less than 10 Ω between the low reference circuit terminal 65 at the K114B Hybrid/EV Powertrain Control Module 2 and terminal G1 at the T6 Power Inverter Module connector X1.

  - **If 10 Ω or greater**

    Repair the open/high resistance in the circuit.

  - **If less than 10 Ω**

13. Test for infinite resistance between low reference circuit terminal 65 at the K114B Hybrid/EV Powertrain Control Module 2 and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
14. Disconnect T6 Power Inverter Module high voltage connector X2, if not already removed during the High Voltage Disabling procedure. Verify that the high voltage interlock circuit terminals at the high voltage connector - harness side, are not bent or broken and are OK.
    - **If not OK**

      Replace the high voltage harness.

    - **If OK**
15. Test for less than 10 Ω between the high voltage interlock circuit terminals at the high voltage connector - harness side.
    - **If 10 Ω or greater**

      Replace the high voltage harness.

    - **If less than 10 Ω**
16. Reconnect T6 Power Inverter Module high voltage connector X2.
17. Test for 35 - 45 Ω between the 5 V signal circuit terminal G2 and low reference terminal G1 at T6 Power Inverter Module connector X1, module side.
    - **If not within the specified range**

      Replace the T6 Power Inverter Module.

    - **If within the specified range**
18. Test for infinite resistance between each of the terminals listed below and ground:
    - Terminal G2, module side
    - Terminal G1, module side
    - **If less than infinite resistance**

      Replace the T6 Power Inverter Module.

    - **If infinite resistance**
19. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **300-Volt Battery Positive and Negative Cable Replacement (Generator Battery Control Wiring Junction Block to Drive Motor Battery)** for high voltage harness replacement
- Refer to **High Voltage Battery Control Wiring Junction Block Replacement (With quick charge)** **High Voltage Battery Control Wiring Junction Block Replacement (Without quick charge)** for T24 battery charger-DC replacement.
- Refer to **Control Module References** for T6 power inverter module or K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

Hybrid/EV Battery Interface Control Module 11 Cell Balancing Circuit

DTC P3041

Hybrid/EV Battery Interface Control Module 12 Cell Balancing Circuit

Circuit/System Description

The high voltage hybrid/EV battery contains 288 individual cells. Three cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid/EV battery assembly.

To maintain a similar state of charge on the cell groups, the hybrid/EV powertrain control module 2 looks at the cell group voltages and determines which cell groups need energy removed in order to maintain the battery groups at a similar state of charge. This is known as cell balancing. There is a transistor switched resistor wired in parallel with the cell group internal to the hybrid/EV battery interface control module portion of the battery energy control module. The hybrid/EV powertrain control module 2 sends a command to the hybrid/EV battery energy control module to begin cell balancing.

Conditions for Running the DTC

- The hybrid/EV battery energy control module is awake and communicating.
- The high voltage fault circuit diagnostic is not running.
- The cell balancing circuit is greater than 3.0 V.

- None of the following DTCs are set, P1E8E, P1E94, P1E9A, P1EA0, P1FBD, P1FBE, P1FBF, P1FC0, P1FC1, P1FC2, P3037, P3042, U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, or U2624.

Conditions for Setting the DTC

The battery energy control module has detected an internal cell balancing switch fault.

Actions Taken When the DTC Sets

- DTCs P1E92, P1E98, P1E9E, P1EA4, P1FC9, P1FCA, P1FCB, P1FCC, P1FCD, P1FCE, P3036, and P3041 are Type A DTCs.
- Cell balancing is disabled.
- The vehicle will operate in a reduced power mode.

Conditions for Clearing the DTC

DTCs P1E92, P1E98, P1E9E, P1EA4, P1FC9, P1FCA, P1FCB, P1FCC, P1FCD, P1FCE, P3036, and P3041 are Type A DTCs.

     1. Disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.

    2. Replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .

    - **If none of the DTCs are set**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K16 battery energy control module replacement, programming and setup.

DTC P1EAB OR P1EAC: BATTERY ENERGY CONTROL MODULE HYBRID/EV BATTERY CELL HIGH VOLTAGE AND/OR HYBRID/EV BATTERY CELL OVERVOLTAGE SIGNAL CIRCUIT PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1EAB

Battery Energy Control Module Hybrid/EV Battery Cell High Voltage

DTC P1EAC

Hybrid/EV Battery Cell Overvoltage Signal Circuit Performance

Circuit/System Description

The 2nd protection circuit is a redundant method to monitor cell group overvoltage. The 2nd protection circuit is the actual hardwire signal from the battery energy control module to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 monitors this line to determine when a cell group overvoltage condition exists, independently of the cell group diagnostic trouble codes transmitted via serial data from the battery energy control module to the hybrid powertrain control module 2.

The 2nd protection self test diagnostic is used to check the signal circuit. The battery energy control module performs this test, once, every power up cycle. When run/crank input signal transitions high and after a calibrated delay, the battery energy control module informs the hybrid/EV powertrain control module 2, via serial data communication bus that it is about to run the diagnostics on the 2nd protection circuit. The battery energy control module then proceeds to command, via internal serial data, each of its internal battery interface control modules to run the check on its hardwire output. Each of the battery interface control modules pulls the signal circuit low and releases it, in sequence. If any pulses are missing, the battery energy control module sets a related fault, and sends this information to the hybrid/EV powertrain control module 2 on the serial data. Additionally, the hybrid powertrain control module 2 monitors the 2nd protection circuit for opens, shorts to ground and shorts to voltage.

Conditions for Running the DTC

P1EAB

- The battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- DTC P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P1B46, P1B49, P1B4C, P1B4F, P1B52, P1B55, P1B58, P1B5B, P1B5E, P1B61, P1B64, P1B67, P1B6A, P1B6D, P1B70, P1B73, P1B76, P1B79, P1B7C, P1B7F, P1B82, P1B85, P1B88, P1B8B, P1B8E, P1B91, P1B94, P1B97, P1B9A, P1B9D, P1BA0, P1BA3, P1BA6, P1BA9, P1BAC, P1BAF, P1BB2, P1BB5, P1BB8, P1BBB, P1BBE, P1BC1, P1BC4, P1BC7, P1BCA, P1BCD, P1BD0, P1BD3, P1BD6, P1BD9, P1BDC, P1BDF, P1BE2, P1BE5, P1BE8, P1BEB, P1BEE, P1BF1, P1BF4, P1BF7, P1BFA, P1BFD, P1E02, P1E05, P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27, P1B47, P1B4A, P1B4D, P1B50, P1B53, P1B56, P1B59, P1B5C, P1B5F, P1B62, P1B65, P1B68, P1B6B, P1B6E, P1B71, P1B74, P1B77, P1B7A, P1B7D, P1B80, P1B83, P1B86, P1B89, P1B8C, P1B8F, P1B92, P1B95, P1B98, P1B9B, P1B9E, P1BA1, P1BA4, P1BA7, P1BAA, P1BAD, P1BB0, P1BB3, P1BB6, P1BB9, P1BBC, P1BBF, P1BC2, P1BC5, P1BC8, P1BCB, P1BCE, P1BD1, P1BD4, P1BD7, P1BDA, P1BDD, P1BE0, P1BE3, P1BE6, P1BE9, P1BEC, P1BEF, P1BF2, P1BF5, P1BF8,

P1BFB, P1BFE, P1E03, P1E06, P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B77, P0B7C, P0B81, P0B86, P0B8B, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E86, P1E87, P1E88, P1E89, P1E8A, U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, U2624, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, P1FA6, P1FA7, P1FA8, P1FA9, P1FAA, P1FAB, P3030, P303B, U0111, or U185A is not set

- The 12 V battery voltage is greater than or equal to 10.2 V.
- Vehicle must be cycled from Vehicle OFF to Vehicle ON.
- Vehicle is ON for greater than 5 seconds.
- Hybrid powertrain control module 1 detects high voltage bus is greater than 312 V.
- Battery charging is not active.

P1EAC

- The battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- DTC U0111 or U185A is not set.
- The 12 V battery voltage greater than or equal to 10.2 V.
- Vehicle must be cycled from Vehicle OFF to Vehicle ON.
- Vehicle is ON for greater than 5 seconds.

Conditions for Setting the DTC

P1EAB

A cell group voltage of greater than 4.5 V is detected.

OR

The hybrid powertrain control module 2 has detected a fault with the 2nd protection circuit.

P1EAC

The hybrid/EV powertrain control module 2 has detected a fault with the 2nd protection circuit.

Action Taken When the DTC Sets

DTCs P1EAB and P1EAC are type A DTCs.

P1EAB

Once the vehicle has been turned OFF, the hybrid/EV powertrain control module 2 will lock out the high voltage contactors until the **Clear Secured High Voltage DTCs** procedure has been performed.

P1EAC

The vehicle will operate in a reduced power mode.

Conditions for Clearing the DTC

- DTCs P1EAB and P1EAC are type A DTCs.
- Vehicle Power cycled from ON to OFF after code clear.

P1EAB

After the repair for DTC P1EAB, with a scan tool, perform the **Clear Secured High Voltage DTCs** repair instruction.

Diagnostic Aids

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group and corresponding DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0B3B, P0B3D, P0B3E, P0B40, P0B42, P0B43, P0B45, P0B47, P0B48, P0B4A, P0B4C, P0B4D, P0B4F, P0B51, P0B54, P0B52, P0B56, P0B57, P0B59, P0B5B, P0B5C, P0B5E, P0B60, P0B61, P0B63, P0B65, P0B66, P0B68, P0B6A, P0B6B, P0B6D, P0B6F, P0B70, P0B72, P0B74, P0B75, P0B77, P0B79, P0B7A, P0B7C, P0B7E, P0B7F, P0B81, P0B83, P0B84, P0B86, P0B88, P0B89, P0B8B, P0B8D, P0B8E, P0B90, P0B92, P0B93, P0B95, P0B97, P0B98, P0B9A, P0B9C, P0B9D, P0B9F, P0BA1, P0BA2, P0BA4, P0BA6, P0BA7, P0BA9, P0BAB, P0BAC, P0BAE, P0BB0, P0BB1, P0BB3, P0BB5, P0BB6, P0BB8, P0BBA, P0BBB, P1B17, P1B18, P1B1A, P1B1B, P1B1D, P1B1E, P1B20, P1B21, P1B23, P1B24, P1B26, P1B27, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1B46, P1B47, P1B4A, P1B4C, P1B4D, P1B4F, P1B50, P1B52, P1B53, P1B55, P1B56, P1B58, P1B59, P1B5B, P1B5C, P1B5E, P1B5F, P1B61, P1B64, P1B62, P1B65, P1B67, P1B68, P1B6A, P1B6B, P1B6D, P1B6E, P1B70, P1B71, P1B73, P1B74, P1B76, P1B77, P1B79, P1B7A, P1B7C, P1B7D, P1B7F, P1B80, P1B82, P1B83, P1B85, P1B86, P1B88, P1B89, P1B8B, P1B8C, P1B8E, P1B8F, P1B91, P1B92, P1B94, P1B95, P1B97, P1B98, P1B9A, P1B9B, P1B9D, P1B9E, P1BA0, P1BA1, P1BA3, P1BA4, P1BA6, P1BA7, P1BA9, P1BAA, P1BAC, P1BAD, P1BAF, P1BB0, P1BB2, P1BB3, P1BB5, P1BB6, P1BB8, P1BB9, P1BBB, P1BBC, P1BBE, P1BBF, P1BC1, P1BC2, P1BC4, P1BC5, P1BC7, P1BC8, P1BCA, P1BCB, P1BCD, P1BCE, P1BD0, P1BD1, P1BD3, P1BD4, P1BD6, P1BD7, P1BD9, P1BDA, P1BDC, P1BDD, P1BDF, P1BE0, P1BE2, P1BE3, P1BE5,

P1BE6, P1BE8, P1BE9, P1BEB, P1BEC, P1BEE, P1BEF, P1BF1, P1BF2, P1BF4, P1BF5, P1BF7, P1BF8, P1BFA, P1BFB, P1BFD, P1BFE, P1E02, P1E03, P1E05, P1E06, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6D, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, U2603, U2604, U2605, or U2606 is not set.

- **If any of the DTCs are set**

  Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

- **If none of the DTCs are set**

3. Verify that DTC P1EAB or P1EAC is not set.
   - **If DTC P1EAB or P1EAC is set**

     Refer to Circuit/System Testing

   - **If DTC P1EAB or P1EAC is not set**
4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle in Service Mode.
2. Verify the hybrid/EV powertrain control module 2 scan tool Maximum Hybrid/EV Battery Module Voltage parameter is 4.5 V or less.
   - **If greater than 4.5 V**

     Replace the A4 Hybrid/EV Battery Pack.

   - **If 4.5 V or less**
3. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.

   NOTE: **Connecting the 12 V battery with the manual service disconnect removed will set DTCs.**

4. Connect the 12 V battery. Disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack. Vehicle in Service Mode.
5. Test for 4.8 - 5.2 V between the signal circuit terminal 9 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid Powertrain Control Module 2.
2. Test for infinite resistance between the signal circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K114B Hybrid Powertrain Control Module 2. After the repair, with a scan tool, perform the **Clear Secured High Voltage DTCs** repair instruction.

- **If 5.2 V or greater**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2. After the repair, with a scan tool, perform the **Clear Secured High Voltage DTCs** repair instruction.

- **If between 4.8 - 5.2 V**

6. Vehicle OFF, remove the A4 Hybrid/EV Battery Pack Cover. Refer to **Battery Upper Cover Replacement** .
7. Connect **EL-50214** Low Voltage Jumper Harness Extension. Disconnect the X8 harness connector at the K16 Battery Energy Control Module. Vehicle in Service Mode.
8. Test for 4.8 - 5.2 V between the signal circuit terminal 8 and ground.
    - **If not within the specified range**

      Replace the Hybrid/EV Battery Pack Internal Harness. After the repair, with a scan tool, perform the **Clear Secured High Voltage DTCs** repair instruction.

    - **If within the specified range**
9. Replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)** for A4 Hybrid/EV Battery Pack replacement.
- Refer to **Drive Motor Battery Control Module Wiring Harness Replacement** for hybrid/EV battery pack internal harness replacement
- Refer to **Control Module References** for K16 battery energy control module or K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P1EAD-P1EB0 OR P3240-P3253: HYBRID/EV BATTERY INTERFACE CONTROL MODULE 1-12 CELL OVERVOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**

Hybrid/EV Battery Interface Control Module 12 Cell Overvoltage Signal Circuit

Circuit/System Description

The hybrid battery contains 288 individual cells. Three cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid battery assembly.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at connectors located on the end of the battery module. A voltage sense harness joins these connectors to the battery energy control module.

The battery energy control module contains internal interface control modules that monitor specific cell groups.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

P1EAD, P1EAE, P1EAF, P1EB0, P3240, P3241, P3242, P3243, P3244, P3245, P3246, P3247, P3248, P3249, P324A, P324B, P324C, P324D, P324E, P324F, P3250, P3251, P3252, and P3253

- The battery energy control module is awake and communicating.
- The 12 V battery voltage greater than or equal to 10.2 V.
- The high voltage bus as measured by the hybrid powertrain control module 1 is greater than 312V.
- None of the following DTCs are set; P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B72, P0B77, P0B7C, P0B81, P0B86, P0B8B, P0B90, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6D, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, P1E8B, U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, or U2624.

Conditions for Setting the DTC

P1EAD, P1EAE, P1EAF, P1EB0, P3245, P3247, P3249, P324B, P324D, P324F, P3251, and P3253

The battery energy control module has not detected a response from the internal interface control module overvoltage signal circuit test that occurs within 50 seconds of key-ON.

P3240, P3241, P3242, P3243, P3244, P3246, P3248, P324A, P324C, P324E, P3250, and P3252

The battery energy control module has detected a cell group voltage of greater than 4.5V.

OR

The battery energy control module detects a failure of the internal interface control module overvoltage signal circuit.

Actions Taken When the DTC Sets

DTCs P1EAD, P1EAE, P1EAF, P1EB0, P3240, P3241, P3242, P3243, P3244, P3245, P3246, P3247, P3248, P3249, P324A, P324B, P324C, P324D, P324E, P324F, P3250, P3251, P3252, and P3253 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P1EAD, P1EAE, P1EAF, P1EB0, P3240, P3241, P3242, P3243, P3244, P3245, P3246, P3247, P3248, P3249, P324A, P324B, P324C, P324D, P324E, P324F, P3250, P3251, P3252, and P3253 are Type A DTCs.

Circuit/System Verification

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify that DTC P1EAD, P1EAE, P1EAF, P1EB0, P3245, P3247, P3249, P324B, P324D, P324F, P3251, or P3253 is not set.
   - **If DTC P1EAD, P1EAE, P1EAF, P1EB0, P3245, P3247, P3249, P324B, P324D, P324F, P3251, or P3253 is set**
   1. Disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
   2. Replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
   - **If none of the DTCs are set**
2. Verify that DTC P3240, P3241, P3242, P3243, P3244, P3246, P3248, P324A, P324C, P324E, P3250, or P3252 is not set.
   - **If DTC P3240, P3241, P3242, P3243, P3244, P3246, P3248, P324A, P324C, P324E, P3250, or P3252 is set**
   1. Disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
   2. Replace the A4 Hybrid/EV Battery Pack.
   - **If none of the DTCs are set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)** for A4 Hybrid/EV Battery Pack replacement
- Refer to **Control Module References** for K16 battery energy control module programming and setup.

Circuit/System Description

The hybrid battery contains 288 individual cells. Three cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid battery assembly.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at connectors located on the end of the battery module. A voltage sense harness joins these connectors to the battery energy control module.

The battery energy control module contains internal interface control modules that monitor specific cell groups.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

P1FD5, P1FD6, P1FD7, P1FD8, P1FD9, P1FDA, P1FDB, P1FDC, P1FDD, P1FDE, P1FDF, P1FE0, P1FE1, P1FE2, P1FE3, P1FE4, P1FE5, P1FE6, P1FE7, P1FE8, P3038, P3039, P3043, and P3044

- The hybrid/EV battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- None of the hybrid/EV battery energy control module loss of communication with hybrid/EV battery interface control module 1 - 12 DTCs are set.
- None of the hybrid/EV battery interface control module 1 - 12 performance DTCs are set.

P1FE9, P1FEA, P1FEB, P1FEC, P1FED, P1FEE, P1FEF, P1FF0, P1FF1, P1FF2, P303A, and P3045

- The hybrid/EV battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- None of the hybrid/EV battery energy control module loss of communication with hybrid/EV battery interface control module 1 - 12 DTCs are set.
- None of the hybrid/EV battery interface control module 1 - 12 performance DTCs are set.
- None of the hybrid/EV battery 1 - 96 circuit low voltage DTCs are set.
- None of the hybrid/EV battery 1 - 96 circuit high voltage DTCs are set.
- None of the hybrid/EV battery 1 - 96 circuit DTCs are set.

Conditions for Setting the DTC

P1FD5, P1FD6, P1FD7, P1FD8, P1FD9, P1FDA, P1FDB, P1FDC, P1FDD, P1FDE, P3038, and P3043

A hybrid/EV battery interface control module has detected the voltage sum of 8 cell groups in a section are less than 1.5 V.

P1FDF, P1FE0, P1FE1, P1FE2, P1FE3, P1FE4, P1FE5, P1FE6, P1FE7, P1FE8, P3039, and P3044

A hybrid/EV battery interface control module has detected the voltage sum of 8 cell groups in a section are greater than 48.5 V.

P1FE9, P1FEA, P1FEB, P1FEC, P1FED, P1FEE, P1FEF, P1FF0, P1FF1, P1FF2, P303A, and P3045

A hybrid/EV battery interface control module has detected a deviation between the module voltage sum of a half section minus the voltage sum of 8 individual cell groups in a section is greater than 0.6 V

Actions Taken When the DTC Sets

- DTCs P1FD5, P1FD6, P1FD7, P1FD8, P1FD9, P1FDA, P1FDB, P1FDC, P1FDD, P1FDE, P1FDF, P1FE0, P1FE1, P1FE2, P1FE3, P1FE4, P1FE5, P1FE6, P1FE7, P1FE8, P1FE9, P1FEA, P1FEB, P1FEC, P1FED, P1FEE, P1FEF, P1FF0, P1FF1, P1FF2, P3038, P3039, P303A, P3043, P3044, and P3045 are Type A DTCs.
- The vehicle will operate in a reduced power mode.

Conditions for Clearing the DTC

DTCs P1FD5, P1FD6, P1FD7, P1FD8, P1FD9, P1FDA, P1FDB, P1FDC, P1FDD, P1FDE, P1FDF, P1FE0, P1FE1, P1FE2, P1FE3, P1FE4, P1FE5, P1FE6, P1FE7, P1FE8, P1FE9, P1FEA, P1FEB, P1FEC, P1FED, P1FEE, P1FEF, P1FF0, P1FF1, P1FF2, P3038, P3039, P303A, P3043, P3044, and P3045 are Type A DTCs.

Circuit/System Verification

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify that DTC P1FD5-P1FF2, P3038, P3039, P303A, or P3043-P3045 is not set.
    - **If DTC P1FD5-P1FF2, P3038, P3039, P303A, or P3043-P3045 is set**
    1. Vehicle OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
    2. Replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
    - **If none of the DTCs are set**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K16 battery energy control module replacement, programming and setup.

DTC P1F17: SYSTEM ISOLATION/IMPACT SENSOR FAULT - HYBRID/EV BATTERY SYSTEM CONTACTORS OPEN

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1F17

System Isolation/Impact Sensor Fault - Hybrid/EV Battery System Contactors Open

Circuit/System Description

The hybrid/EV powertrain control module 2 will set DTC P1F17 if the hybrid/EV powertrain control module 1 has detected a passive loss of isolation, the supplemental inflatable restraint sensors are not working or has lost communications with the hybrid/EV powertrain control module 1 and the supplemental inflatable restraint module.

Conditions for Running the DTC

Vehicle ON.

Conditions for Setting the DTC

- P1AF0, P1AF2, or P1E22 is set in the hybrid/EV powertrain control module 1.
- The supplemental inflatable restraint module roll over, air bag, or inertia sensors are not working.

OR

- P1AF0, P1AF2, or P1E22 is set in the hybrid/EV powertrain control module 1.
- DTC U184E is set.

OR

- The hybrid/EV powertrain control module 2 has lost communications with the hybrid/EV powertrain control module 1.
- DTC U184E is set.

OR

- The hybrid/EV powertrain control module 2 has lost communications with the hybrid/EV powertrain control module 1.
- The supplemental inflatable restraint module roll over, air bag, or inertia sensors are not working.

Action Taken When the DTC Sets

- DTC P1F17 is a type A DTC.
- All of the contactors will be prevented from closing.

Conditions for Clearing the DTC

- DTC P1F17 is a type A DTC.
- The **Clear Secured High Voltage DTCs** reset function must be performed with a scan tool before clear codes.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that no other DTCs are set.
    - **If any other DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If none of the DTCs are set**
3. Verify that DTC P1F17 is not set.
    - **If DTC P1F17 is set**
    1. Verify the K36 Inflatable Restraint Sensing And Diagnostic Module is programmed with the correct software calibration.
        - If the correct software is not installed, program the K36 Inflatable Restraint Sensing And Diagnostic Module.
        - If the correct software is installed
    2. Perform the **Clear Secured High Voltage DTCs** repair instruction.
    3. Verify that DTC P1F17 does not set while operating the vehicle within the Conditions for Running the DTC.
        - If DTC P1F17 is set, replace the K114B Hybrid Powertrain Control Module 2.
        - If DTC P1F17 is not set
    4. All OK.
    - **If DTC P1F17 is not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for hybrid/EV powertrain control module 2 and inflatable restraint sensing and diagnostic module replacement, programming and setup.

DTC P1FF4: SYSTEM ISOLATION/IMPACT SENSOR FAULT - HYBRID/EV BATTERY SYSTEM CONTACTORS OPEN

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1FF4

System Isolation/Impact Sensor Fault - Hybrid/EV Battery System Contactors Open

Circuit/System Description

The hybrid/EV powertrain control module 2 will set DTC P1FF4 if the hybrid/EV powertrain control module 1 has detected a passive loss of isolation, the supplemental inflatable restraint sensors are not working or has lost communications with the hybrid/EV powertrain control module 1 and the supplemental inflatable restraint module.

Conditions for Running the DTC

- Vehicle ON.
- The 12 V battery voltage is greater than 9 V.

Conditions for Setting the DTC

- P0AA1 and P301C is set.

  OR

- P0AA4 and P301D is set.

  OR

- P301C and P301D is set.

Action Taken When the DTC Sets

- DTC P1FF4 is a type A DTC.
- All of the contactors will be prevented from closing.
- Charging is disabled.

Conditions for Clearing the DTC

- DTC P1FF4 is a type A DTC.
- The **DC Charging Disabled Reset** function must be performed with a scan tool before clear codes.

Circuit/System Verification

1. Verify that no other DTCs are set.
    - **If any other DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no other DTCs are set**

2. Verify the K36 Inflatable Restraint Sensing And Diagnostic Module is programmed with the correct software calibration.
   - **If the correct software is not installed**

     Program the K36 Inflatable Restraint Sensing And Diagnostic Module. Refer to **Control Module References**

   - **If the correct software is installed**
3. Perform the **High Voltage System Inspection**
4. Perform the **DC Charging Disabled Reset** .
5. If DTC P1FF4 is set, clear the DTC. Review and operate the vehicle according to the DTC Conditions for Running. Verify that DTC P1FF4 does not reset and no other DTCs are set.
   - **If any other DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If DTC P1FF4 is set**

     Replace the K114B Hybrid/EV Powertrain Control Module 2.

   - **If no DTCs are set**
6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for hybrid/EV powertrain control module 2 and inflatable restraint sensing and diagnostic module replacement, programming and setup.

LOSS OF ISOLATION ON THE HIGH VOLTAGE MAIN BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

Vehicles equipped with high voltage energy storage are designed with the high voltage circuits isolated from the vehicle chassis. If either the positive or negative high voltage Direct Current (DC) circuits or any of the high voltage Alternating Current (AC) phase circuits lose this isolation to the vehicle chassis, one or more diagnostic trouble codes (DTCs) may set.

The vehicle utilizes Passive and Active isolation testing to determine the amount of isolation between the high voltage and the chassis.

Passive isolation testing is performed within the power inverter module and tests whenever the high voltage main contactors are closed. Utilizing a high impedance resistor network, passive isolation detection monitors all high voltage components including the hybrid/EV battery pack and isolation loss results in DTCs P1AF0, P1AF2 and/or P1E22. Real-time status of passive isolation detection can be determined by observing the delta between the Positive Supply Isolation Voltage and Negative Supply Isolation Voltage scan tool parameters. The parameters are displayed by any of the Motor Control Modules and can also be observed in certain hybrid powertrain control module 2 data lists.

Active isolation testing is performed by the hybrid powertrain control module 2 and tests after the high voltage main contactors open. Utilizing an injected AC signal, active isolation detection monitors the internal Hybrid/EV battery pack as well as the charging system direct current (DC) high voltage circuits and isolation loss results in DTCs P0AA6 or P0DAA. Status for the prior active isolation detection event can be determined by observing the hybrid powertrain control module 2 Isolation Test Resistance scan tool parameter. Real-time status observation requires the HPCM2 scan tool control function Hybrid/EV Battery Pack Isolation Test.

Diagnosis for isolation requires testing with high voltage potential. Special insulation testing multimeters such as the **EL-50772** utilize their own internal high voltage and must be used to test the isolation capability of high voltage components and circuits. Refer to Troubleshooting With an Insulation Multimeter.

Diagnostic Aids

Prior to disabling high voltage:

Monitoring certain scan tool parameters when high voltage is active may help to identify which high voltage components and circuits have lost their chassis isolation. The Vehicle Information selection within the HPCM2 scan tool Data Display contains many parameters related to isolation diagnosis. The Drive Motor Control Module Positive Supply Isolation Voltage and Drive Motor Control Module Negative Supply Isolation Voltage parameters provide a real-time indication of isolation status. The parameters will shift in respect to one another relative to the level of isolation loss. The greater the delta, or difference, between parameters, the less isolation exists between high voltage and the vehicle chassis.

Isolation Loss between HV Components and Chassis, Positive Side*

Isolation between HV Bus and Chassis	Normal Vehicle	10M	5M	1M	500K	200K Approximate Passive Isolation DTC set point	100K	None - Direct Short
Positive Isolation Parameter*	198V	180V	165V	110V	75V	35V	20V	0V
Negative Isolation Parameter*	192V	210V	225V	280V	315V	355V	370V	390V
Delta Between Parameters	0 - 15V	30V	60V	170V	240V	320V	350V	390V
*Typical values observed with a fully charged pack, 390V. A short to the positive bus is shown, a short to the negative bus would display inverted voltages of similar value.								

Certain isolation loss concerns may only appear during high moisture environmental conditions. Drive the vehicle thru an underbody spraying-style car wash while monitoring the delta between Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters.

Isolation loss might only occur when a high voltage device is active. Use the High Voltage Component Test Method table and operate each HV component while monitoring the delta between Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters.

High Voltage Component Test Methods

HV Component	Scan Tool Parameter	Most Complete Test Method
G1 Electric A/C Compressor	Power Requested by Electric A/C Compressor from Hybrid/EV Battery Pack (HPCM2)	HVAC Cabin Controls and monitor parameter Isolation Voltages Delta
K10 Coolant Heater	Power Requested by Electric Passenger Compartment Heater from Hybrid/EV Battery Pack (HPCM2)	HVAC Cabin Controls and monitor parameter Isolation Voltages Delta
E54 Battery Heater*	Hybrid/EV Battery Pack Heater Power Command (HPCM2)	Hybrid/EV Battery Pack Heater Power GDS2 Scan Tool Control Function (HPCM2) and monitor parameter Isolation Voltages Delta
		Review the DTC P1EC6 Conditions for Running and monitor parameter Isolation Voltages Delta while heater is commanded ON
T18 Battery Charger	N/A - Active During Charge	Insulation Multimeter
T24 Battery Charger - DC (CBT)	N/A - Active During Charge and Active with High Voltage Enabled	Insulation Multimeter
T24 Battery Charger - DC (w/o CBT)	N/A - Always Active with High Voltage Enabled	Insulation Multimeter
K1 14V Power Module	14V Module High Voltage Circuit Current (HPCM1)	Insulation Multimeter
T6 Power Inverter Module	N/A - Always Active with High Voltage Enabled	Insulation Multimeter
M15 Drive Motor	N/A - Always Active with High Voltage Enabled	Insulation Multimeter

HV Component	Scan Tool Parameter	Most Complete Test Method
A4 Battery Pack - Internal Side of Contactors	Isolation Concern Results in DTC P0AA6/P0DAA	
*Because the E54 Battery Heater is always connected to the positive bus, an isolation fault may result in a delta decrease when commanded ON.		

After disabling high voltage:

High Voltage cables disconnected at each end from their respective modules must be tested with the insulation meter connected to their shield circuit and not to vehicle chassis.

The **EL-50772** insulation meter, when set to the 500V scale, indicates 550M Ω when measuring infinite or open circuit conditions. An equivalent meter may display 'infinite' value in a different manner.

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Remove all vehicle chargers.
2. Vehicle ON.
3. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D09, P0D0A, P1EBD, P1EC0, or P1EC3 is not set.
    - **If any DTC is set**

      Refer to **DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D09, P0D0A, P1EBD, P1EC0, or P1EC3**.

    - **If none of the DTCs are set**
4. Verify that DTC P0AA6 or P1AE6 is not set.
    - **If any DTC is set**

      Refer to **DTC P0AA6 or P1AE6**.

    - **If none of the DTCs are set**

5. Vehicle ON. Confirm propulsion system is active with battery positive and negative high voltage contactors closed. You cannot continue with loss of isolation diagnosis if high voltage is not active.
   - **If high voltage is not active**

     Diagnose and repair appropriate DTCs and repeat Circuit/System Verification. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If high voltage is active**

NOTE: **Isolation related parameters from several modules can all be observed in hybrid powertrain control module 2, Data Display, Vehicle Information.**

6. Vehicle ON, observe the scan tool Drive Motor Positive Supply Isolation Voltage and the Drive Motor Negative Supply Isolation Voltage scan tool parameters.
7. Is the delta, or difference, between the Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters greater than 15 volts?
   - **If the delta is greater than 15 volts**

     Using the High Voltage Component Test Methods table as a guide, observe and record which components are active. Refer to Circuit/System Testing.

   - **If the delta is 15 volts or less**
8. Using the High Voltage Component Test Method table as a guide, turn ON devices one at a time while monitoring the isolation voltage delta.
9. Is the delta between the Drive Motor Positive Supply Isolation Voltage and the Drive Motor Negative Supply Isolation Voltage scan tool parameters greater than 15 volts when a component is active?
   - **If the delta is greater than 15 volts**

     Observe and record which components are active. Refer to Circuit/System Testing.

   - **If the delta is 15 volts or less**
10. Turn the vehicle OFF, open and close the drivers door and wait 2 minutes.
11. PRESS and HOLD the brake pedal and activate the HPCM2 scan tool control function Hybrid/EV Battery Pack Isolation Test. The battery pack isolation test will complete in less than a minute. Verify the Isolation Test Resistance parameter when the test is complete is greater than 600K Ω.
    - **If the resistance is 600K Ω or less**

      Refer to **DTC P0AA6 or P1AE6**.

    - **If the resistance is greater than 600K Ω**
12. Vehicle OFF. Connect the vehicle charge cord-AC. Ensure charge mode is active.
13. With charge mode already active, Vehicle ON and observe the scan tool Drive Motor Positive Supply Isolation Voltage and the Drive Motor Negative Supply Isolation Voltage scan tool parameters.
14. Is the delta between the Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters greater than 15 volts?
    - **If the delta is greater than 15 volts**

      Refer to Circuit/System Testing.

    - **If the delta is less than 15 volts**
15. All OK, review Diagnostic Aids.

Circuit/System Testing

WARNING: **Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.**

WARNING: **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:**

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: **This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.**

Failure to follow the procedure exactly as written may result in serious injury or death.

NOTE: **Wear your High Voltage Insulation gloves until you have determined that a high voltage exposure risk is no longer present.**

1. Vehicle OFF, disable the high voltage for every high voltage component. Refer to High Voltage Disabling.
2. Ensure only the **EL-50772** Insulation Multimeter or equivalent is used with this procedure. Select the Isolation Test setting, then select the 500V range. Refer to Troubleshooting With an Insulation Multimeter for important usage instructions.
3. Print the Complete High Voltage system schematic to assist you in your testing. Refer to Hybrid/EV System High Voltage Isolation Description .
4. Print the Component Isolation Test Table below.

NOTE:

- **You may test components in any order, if you identified a component in Circuit/System Verification that affects the isolation delta, test that component first.**
- **The component should be disconnected from all other high voltage components when testing.**
- **Test cables between their high voltage terminals and the cable shield, not chassis ground.**
- **Test HV modules/components between their high voltage terminals and the module case if conductive or chassis ground if not conductive.**
- **Test from the components positive high voltage terminal to the shield or chassis ground and then the negative high voltage terminal to the shield or chassis ground, never test from the positive high voltage terminal to the negative high voltage terminal.**
- **Print the Component Isolation Test Table and record your testing results.**

5. Test and record the minimum resistance between each components high voltage terminals and the shield or case/chassis ground as indicated by the Component Isolation Test table.
6. Replace any component that tests less than the expected resistance at any terminal.

Component Isolation Test Table

Component	Component Setup	Insulation Multimeter Test Point	EL-50772 Expected Results	Actual Result
NOTE: **High Voltage MUST be disabled and S15 Manual Service Disconnect removed prior to testing any components. Refer to Circuit/System Verification and Circuit/System Testing.**				
A4 Battery Pack - X3	Test battery pack side	DC Neg- HV terminal to battery pack ground strap	550M Ω	Â
		DC Pos+ HV terminal to battery pack ground strap	550M Ω	Â

		3 phase AC HV terminal W to cable shield	550M Ω	Â
* There may be up to a 5 second delay for proper test results to be displayed, always press and hold the **EL-50772** test button until maximum measurement values are observed.				

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **300-Volt Battery Positive and Negative Cable Replacement (Generator Battery Control Wiring Junction Block to Drive Motor Battery)**
- Refer to **Air Conditioning and Drive Motor Battery Cooling Compressor Replacement**
- Refer to **Heater Coolant Heater Replacement**
- Refer to **Accessory DC Power Control Module Replacement**
- Refer to **Drive Motor Rotor Removal** , and **Drive Motor Stator Removal** for drive motor replacement.
- Refer to **Drive Motor Power Inverter Module 3 Phase Cable Replacement**
- Refer to **High Voltage Battery Control Wiring Junction Block Replacement (With quick charge) High Voltage Battery Control Wiring Junction Block Replacement (Without quick charge)** for T24 Batter Charger-DC.
- Refer to **High Voltage Battery Disconnect Relay Replacement** for BDU replacement.

- Refer to **Drive Motor Battery Charger Replacement (Except Dubai)** **Drive Motor Battery Charger Replacement (Dubai)**
- Refer to **Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)** **Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)** **Drive Motor Battery Charger Receptacle Replacement (Dubai only with quick charge)** **Drive Motor Battery Charger Receptacle Replacement (Dubai only without quick charge)**
- Refer to **High Voltage Battery Heater Replacement**
- Refer to **Control Module References** for the T6 power inverter module replacement, programming and setup.

HYBRID/EV BATTERY VOLTAGE PRESENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or safely contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor and precharge negative high voltage contactor. The contactors close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for each high voltage contactor. Ground is provided through a vehicle ground external of the high voltage battery.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High**

Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: **This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.**

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Review the high voltage safety information prior to performing the High Voltage Disabling procedure. Refer to High Voltage Safety
2. Verify the High Voltage Disabling procedure has been performed and the S15 manual service disconnect has been removed.
   - **The procedure has not been performed**

     Refer to High Voltage Disabling before continuing to the next step.

   - **The procedure has been performed**

NOTE: **Connecting the 12 V battery while leaving the S15 manual service disconnect out will set DTCs. Clear these DTCs after all repairs are complete.**

3. Disconnect the low voltage (X357) and (X358) harness connectors at the A4 Hybrid/EV Battery Pack. Connect the 12 V battery. Vehicle in Service Mode.
4. Test for less than 9.5 V at the following points and ground:
   - X358, Terminal 3
   - X358, Terminal 4
   - X358, Terminal 5
   - X358, Terminal 7
   - **If 9.5 V or greater**
   1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.
   - **If less than 9.5 V**
5. Vehicle OFF.

NOTE:

- **Wear your High Voltage Insulation gloves until you have determined that a**

high voltage exposure risk is no longer present.
- **A 9 V battery or the vehicles 12 V battery can be used to test the DMM.**

6. Test the DMM by measuring a known good 9 to 12 V battery.
   - **If the DMM does not properly measure the test battery**

     Repair or replace the DMM and repeat all voltage measurements.

   - **If the DMM does properly measure the test battery**
7. Replace the A4 Hybrid/EV Battery Pack. There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)** for A4 hybrid/EV battery pack replacement.

TROUBLESHOOTING WITH AN INSULATION MULTIMETER

Special Tools

EL-50772 Insulation Multimeter

For regional equivalent tools, refer to **Special Tools**

Diagnosis for isolation loss requires insulation testing with high voltage potential. Special multimeters that utilize their own built-in high voltage, such as the **EL-50772** Insulation Multimeter, test the isolation capability of high voltage components and circuits. Understanding an insulation multimeter and how it functions is necessary to obtain proper test results.

How to Use the Insulation Multimeter

1. Read all instructions and warnings that came with your insulation multimeter.

2. Plug into the correct ports (1, 2) for insulation testing. This is easy to get wrong especially if you use the **EL-50772** for standard DMM testing too. Do NOT use ports (3, 4) for insulation testing.
3. Always test at the 500V range.

6. When performing insulation testing you need a good ground reference. When possible use an alligator clamp to attach the ground lead. Typically, the reference point will be to vehicle chassis except cable testing which requires connection to the cable shield termination at the connector and not to the chassis.
7. Verify your ground connection prior to every test measurement at a suitable ground location near your test point. The **EL-50772** should display 0.0 Ω, indicating continuity.
8. When testing components with large capacitance or inductance, such as certain modules and larger motor stators, it may be necessary to hold the test for a few seconds until the maximum resistance value is displayed.

RECHARGEABLE ENERGY STORAGE SYSTEM SMOKE TEST

Special Tools

- **EL-52015** Volt Battery Smoke Test Leak Adapters
- **GE 41413-A** Evaporative Emissions System Tester (EEST)

Equivalent regional tools: Special Tools

1. Remove the drive motor battery. Refer to Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254) Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254) Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)

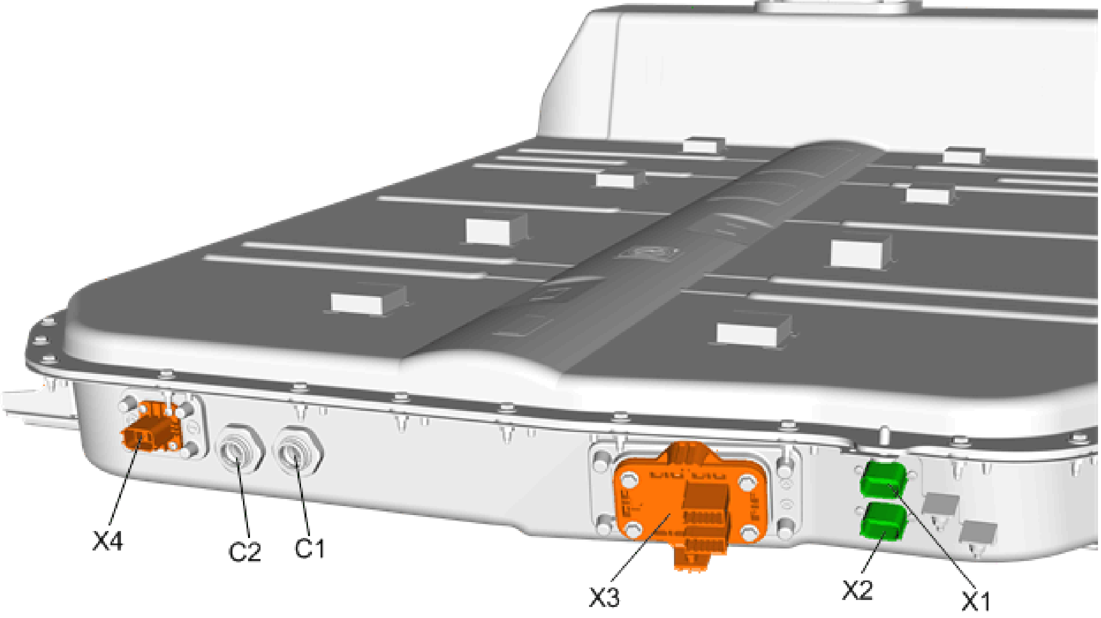

Fig. 31: Drive Motor Battery Connectors
Courtesy of GENERAL MOTORS COMPANY

2. Install the **EL-52015** Drive Motor Battery smoke test leak adapters to the following Drive Motor Battery Connectors:
    - X1
    - X2
    - X3

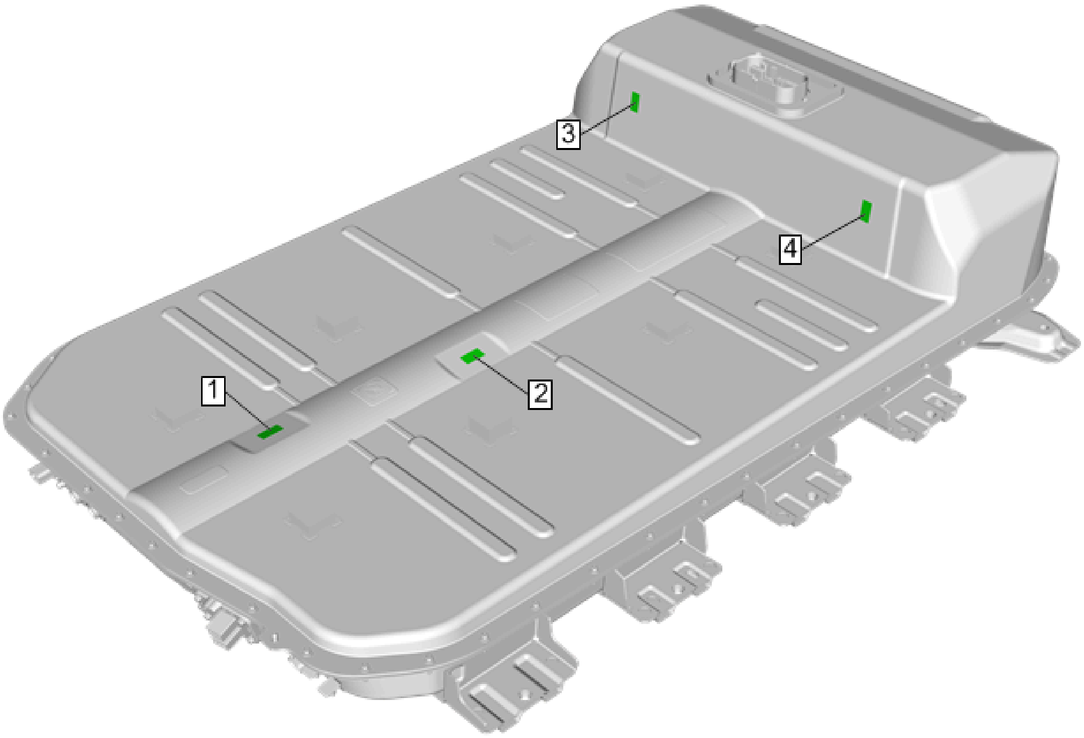

Fig. 32: Gore Patches
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Duct tape is not recommended because of damage to the Gore patches when removing.**

3. Cover all gore patches (1, 2, 3 and 4) with tape.

NOTE: **It is not recommended to use the tester in an outside repair bay area because wind**

and sunlight may affect temperature and your ability to see the smoke.

4. Turn OFF any fans that may cause air movement around or near the Drive Motor Battery.

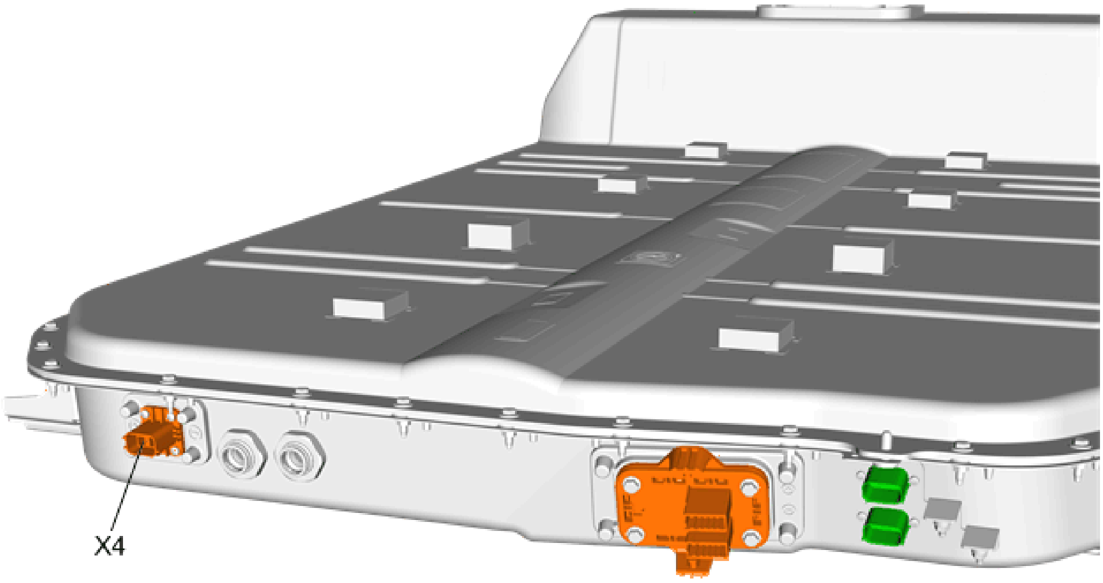

Fig. 33: Drive Motor Battery Connector X4
Courtesy of GENERAL MOTORS COMPANY

5. Install the **GE 41413-A** Evaporative Emissions System Tester (EEST) to connector (X4).

NOTE: **Completely unwind the smoke hose from the bracket for optimal tester performance.**

6. Turn the nitrogen/smoke valve on the control panel to smoke.

NOTE: **The remote switch operates in a push ON, push OFF fashion.**

7. Press and release the remote switch to activate the tester and inject smoke into the Drive Motor Battery.

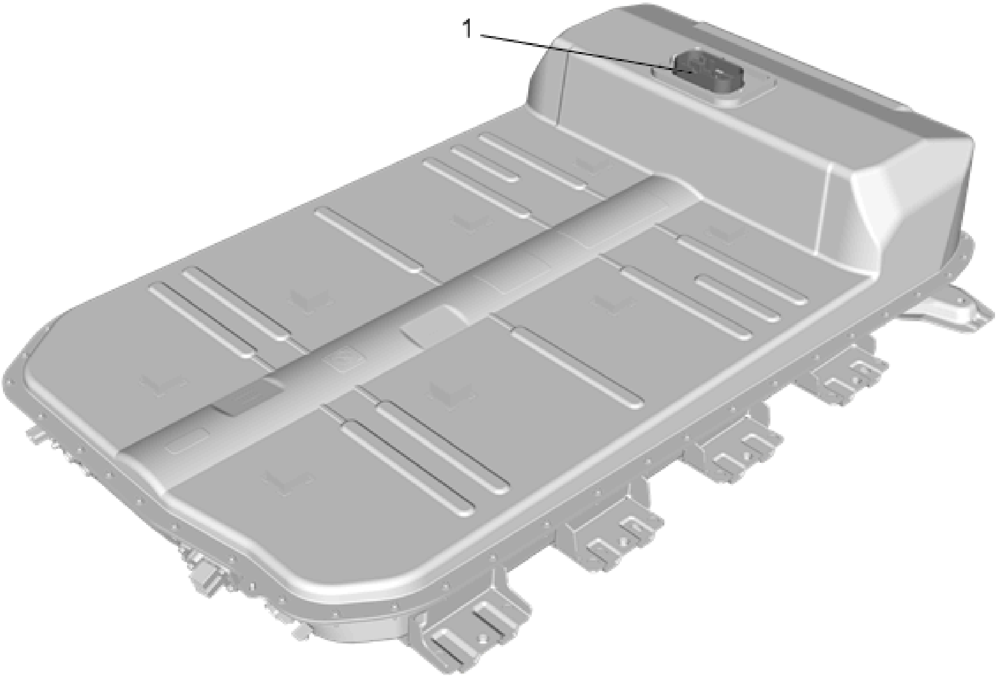

Fig. 34: Manual Service Disconnect Connector
Courtesy of GENERAL MOTORS COMPANY

8. Soak/Fill the RESS with smoke for FIVE MINUTES until smoke is observed from the manual service disconnect connector (1).
9. Install the manual service disconnect lever. Refer to **Drive Motor Battery High Voltage Manual Disconnect Lever Replacement**
10. Introduce smoke into the Drive Motor Battery for up to THREE MINUTES. Using a high-intensity white light, look for any visible smoke emitting anywhere from the Drive Motor Battery.
11. Press and release the remote switch to deactivate the tester.
12. Repair any visible leaks by retightening the fasteners or by resealing any areas.
13. Retest the Drive Motor Battery, to ensure repair has been completed.
14. Remove the masking tape from the gore patches (1, 2, 3 and 4).
15. Remove the manual service disconnect lever. Refer to **Drive Motor Battery High Voltage Manual Disconnect Lever Replacement**
16. Open the nitrogen tank valve and turn the nitrogen/smoke valve on the control panel to Nitrogen.
17. Press and release the remote switch to activate the tester and inject nitrogen into the Drive Motor Battery for FIVE MINUTES, verify no smoke is coming from the vent.
18. Remove all old vents from the Drive Motor Battery.
19. Install NEW Gore patches (P/N 20791600), replacing the old vents.
20. Disconnect the tester and remove the adapters from the Drive Motor Battery.
21. Install the drive motor battery. Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)**

REPAIR INSTRUCTIONS

HIGH VOLTAGE SYSTEM INSPECTION

Circuit/System Description

WARNING: **Damage to a Lithium Ion hybrid/EV battery pack could result in fire, loss of electrical isolation or exposure to high voltage. Until the high voltage system inspection has been completed, store the vehicle with hybrid/EV battery pack installed outside in a secure area away from buildings and other vehicles and protected from rain, snow and other moisture. Remove the hybrid/EV battery pack high voltage manual disconnect lever and store it in a secure place outside the vehicle. Cover the exposed high voltage opening with ULÂ® listed, or equivalent, insulation tape rated at a minimum of 600 V.**

Failure to follow these precautions could result in personal injury, death and property damage.

The Inspection Process

The high voltage system and Hybrid/EV battery pack inspection process consists of two levels of inspection:

1. Component Initial Inspection
2. High Voltage Operation Inspection

Results of the inspection processes may result in:

- Hybrid/EV Battery Depower
- Repair, or replacement and recycling of the Hybrid/EV Battery
- Replacement of high voltage components

Vehicle Collision Detection/High Voltage Lockout

The supplemental inflatable restraint system supplements the protection offered by the seat belts. The supplemental inflatable restraint sensing and diagnostic module determines the severity of a collision with the assistance of impact sensors located at strategic points on the vehicle. The hybrid powertrain control module 2 will open the high voltage contactor relays, placing the vehicle in a high voltage lockout state and disabling the vehicle whenever a crash event of sufficient intensity has been detected.

The supplemental inflatable restraint module transmits through serial data to the hybrid powertrain control module 2 both the crash event status and whenever a sensor fault is detected.

NOTE: **The Crash Event Detected/Air Bag Deployed high voltage lockout state will remain active until cleared by the Clear Secured High Voltage DTCs procedure.**

A complete inspection of the high voltage system must be performed if the vehicle has been involved in a collision.

High Voltage Battery Moisture Exposure

The Lithium Ion hybrid/EV battery pack should be depowered whenever internal components have been exposed to moisture, whether due to vehicle flood, coolant leakage within the hybrid/EV battery pack assembly, etc.

- **EL-50332** EV/HEV Battery Service Tool
- **J-35616-35** Test Probes

Equivalent regional tools: Special Tools .

Component Initial Inspection

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: **High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.**

WARNING: **This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test**

equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Disconnect the 12 V battery.
2. Remove the S15 Manual Service Disconnect. If vehicle damage does not allow for access to the S15 Manual Service Disconnect, remove the damaged portion of the vehicle until such time as the S15 Manual Service Disconnect can be removed.
3. Inspect the Hybrid/EV battery pack for evidence of exposure to fire, either directly or in close proximity.
    - **If exposure to fire is evident**
    1. Depowering of the Hybrid/EV battery pack is recommended. Maintain post-crash 50 foot vehicle isolation until depowering completion. See Battery Depower after inspection is complete.

    NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

    2. After depowering, repair or replace and recycle battery as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
    3. Continue with inspection.
    - **If not exposed to fire**
4. Inspect the Hybrid/EV battery pack enclosure for damage including foreign object intrusion.
    - **If damage is evident**
    1. Depowering of the Hybrid/EV battery pack and/or damaged module section is recommended. Maintain post-crash 50 foot vehicle isolation until depowering completion. See Battery Depower after inspection is complete.

    NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

    2. After depowering, repair or replace and recycle battery as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
    3. Continue with inspection.
    - **If not damaged**
5. Inspect the vehicle for exposure to water at a level higher than the vehicle rocker panel.
    - **If the vehicle was exposed to flood**
    1. Remove the battery drain plug, capture and discard any drained fluid.
    2. Lift the vehicle rear slightly to assist in fluid extraction.
        - If fluid is present
        1. Depowering of the Hybrid/EV battery pack is recommended. Maintain post-crash 50 foot vehicle isolation until depowering completion. See Battery Depower after inspection is complete.

        NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

        2. After depowering, repair or replace and recycle battery as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
        3. Continue with inspection.

    - If fluid was not present

      Install a new drain plug and continue with inspection.

  - **If the vehicle was not flooded**

6. Inspect the battery coolant system for proper level.
   - **If battery coolant level is low**
   1. Verify if the low coolant is the result of system damage external of the A4 Hybrid/EV battery pack.
      - If the cooling system external of the A4 Hybrid/EV Battery Pack is not damaged and/or leaking
      1. Remove the battery drain plug, capture and discard any drained fluid.
      2. Lift the vehicle rear slightly to assist in fluid extraction.
         - If fluid is present
      3. Depowering of the Hybrid/EV battery pack is recommended. Maintain post-crash 50 foot vehicle isolation until depowering completion. See Battery Depower after inspection is complete.

         NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

      4. After depowering, repair or replace and recycle battery as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
      5. Continue with inspection.
         - If fluid is not present
      6. Install a new drain plug and continue with inspection.
      - If the cooling system external of the A4 Hybrid/EV Battery Pack is damaged and/or leaking
   2. Continue with inspection.
   - **If the battery coolant system is at the proper level**

   NOTE: **Post-crash 50 foot vehicle isolation is no longer required if the Hybrid/EV battery pack did not exhibit damage assessed in the steps above.**

7. Inspect each high voltage component listed below for visible damage. Record the results on the High Voltage Component Inspection Table below.
   - E54 Hybrid/EV Battery Pack Coolant Heater
   - G1 Electric A/C Compressor
   - K1 14 V Power Module
   - K10 Coolant Heater Control Module
   - S15 Manual Service Disconnect
   - T6 Power Inverter Module
   - T18 Battery Charger
   - T24 Battery Charger
   - Transmission case
   - All High voltage orange cables
   - **If any high voltage component inspection failed and Hybrid/EV battery Depower is recommended**

     Disconnect the damaged components from the high voltage bus before attempting in-vehicle depowering of the Hybrid/EV battery pack. In extreme cases depowering may need to occur by connecting directly within the Hybrid/EV battery pack with the cover removed. See Battery Depower below.

- **If any high voltage component inspection failed and Hybrid/EV battery Depower is NOT recommended**
    1. Perform the **High Voltage Disabling** procedure and replace the damaged components before attempting to operate the vehicle.
    2. Once you have confirmed or repaired all high voltage component visual integrity, perform High Voltage Operation Inspection below.
- **If all high voltage component inspection passed**

    Perform High Voltage Operation Inspection below.

High Voltage Component Inspection Table

High Voltage Component	Inspection (passed/failed)
E54 Hybrid/EV Battery Pack Coolant Heater	Â
G1 Electric A/C Compressor	Â
K1 14 V Power Module	Â
K10 Coolant Heater Control Module	Â
S15 Manual Service Disconnect	Â
T6 Power Inverter Module	Â
T18 Battery Charger	Â
T24 Battery Charger	Â
Transmission case	Â
All High voltage orange cables	Â

High Voltage Operation Inspection

NOTE: **The vehicle must have a functioning 12 V system and serial data communications to continue.**

1. Verify you have successfully passed the Component Initial Inspection.
    - **If the Component Initial Inspection has failed or not been performed**

        DO NOT CONTINUE. Restart the Inspection procedure.

    - **If the Component Initial Inspection has passed**
2. Install the S15 Manual Service Disconnect. Refer to **Drive Motor Battery High Voltage Manual Disconnect Lever Replacement**.
3. Connect the 12 V battery.
4. Vehicle in Service Mode. With a scan tool select the Hybrid/EV powertrain Control Module 2, Hybrid Battery Pack Contactor Open Reasons data list. Verify if either the Crash Event Detected or Air Bag Deployed parameters indicate YES.
    - **If either parameter displays YES**

        The high voltage contactors may be prevented from closing. The vehicle will not start. Perform the Clear Secured High Voltage DTCs procedure and proceed to the next step.

    - **If BOTH parameters indicate NO**
5. Vehicle ON. With a scan tool check for the following HV system DTCs: Contactor DTCs P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D0A, P0D09, P1EBD, P1EC0, P1EC3, Isolation DTCs P0AA6, P1AE6, P1AF0, or P1AF2, Precharge DTCs P0C76, P0C78 or P3061.
    - **If any DTCs are set**

        Perform the applicable DTC diagnosis/repair. refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If any of the listed DTCs have not run**

        Review the applicable Conditions for Running the DTC.

- **If all the specified DTCs have ran and passed**

  High Voltage System Inspection passed.

Battery Depower

WARNING: **Damage to a Lithium Ion hybrid/EV battery pack could result in fire, loss of electrical isolation or exposure to high voltage. Store the vehicle with hybrid/EV battery pack installed or the hybrid/EV battery pack assembly outside in a secure area away from buildings and other vehicles and protected from rain, snow and other moisture until the hybrid/EV battery pack has been discharged. Remove the hybrid/EV battery pack high voltage manual disconnect lever and store it in a secure place outside the vehicle. Cover the exposed high voltage opening with ULÂ® listed, or equivalent, insulation tape rated at a minimum of 600 V. Contact the GM Technical Assistance Center for discharge instructions prior to storage and shipping of the hybrid/EV battery pack.**

Failure to follow these precautions could result in personal injury, death and property damage.

NOTE: **Depowering of the battery:**

- **Will NOT reduce battery voltage to a safe level. The battery will contain high voltage after depower procedure is complete.**
- **Reduces the state of charge to the lowest level thus reducing the likelihood of a battery fire.**
- **Requires special tool EL-50332 battery service tool.**
- **Allows for future recovery of the battery after an internal battery inspection and/or repair is completed.**

NOTE: **Depowering is not required if hybrid/EV battery pack voltage as either monitored by the hybrid powertrain control module 2 scan tool Hybrid/EV Battery Pack High Voltage parameter or measured with a DMM directly across the battery terminals is 285 volts or less.**

NOTE: **With a full state of charge, the depower process for the complete Hybrid/EV battery pack make take up to 20 hours to complete. You may stop or pause the process at any time.**

Depowering can occur with the Hybrid/EV battery pack in or out of the vehicle. You can configure the **EL-50332** connections to the Hybrid/EV battery pack at any of the following locations:

- High Voltage T24 Battery Charger connection under hood with **EL-50332-335** *
- High Voltage connection at Hybrid/EV Battery Pack with **EL-50332-335** *
- Directly at battery section/cell module terminals with **EL-50332-170**

  *Also requires connection to the contactor relay control circuits with **EL-50332-325** .

The **EL-50332** can be 12 V powered for instances when outlet power is not available. Use the following to operate from a 12 V power source:

- **EL-50332-160** 12 V Auxiliary Power Cable
- **EL-50332-165** 12 V Auxiliary Clamps Adapter Cable

In-Vehicle or Hybrid/EV Battery Pack Cover Installed Depower Instructions

NOTE:

- **The EL-50332 will close the Hybrid/EV battery pack contactors. You must verify the vehicles high voltage system integrity prior**

- **to enabling high voltage. Disconnect visually damaged high voltage components/cables from the high voltage system before attempting in-vehicle depowering.**
- **You must be able to connect to the hybrid/EV battery pack low voltage connectors.**
- **Wear your Personal Protective Equipment for the duration of the battery depower event.**

1. Ensure the integrity of the vehicles high voltage system.
2. Connect the **EL-50332** to the contactor control circuits at the hybrid/EV battery pack low voltage connectors with the **EL-50332-270** interface module and **50332-325** harness.
3. Connect the **EL-50332** to the applicable high voltage connector.
4. Install the manual service disconnect lever.
5. Follow the **EL-50332** on-screen prompts until depower is completed.

NOTE: **Post-crash 50 foot vehicle isolation is no longer required upon successful depower completion.**

6. Remove the manual service disconnect lever.

NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

7. Repair, replace or recycle the hybrid/EV battery pack as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
8. Replace any damaged components noted in the High Voltage Component Inspection before attempting to operate the vehicle.
9. Perform the High Voltage Operation Inspection before attempting to operate the vehicle.

Hybrid/EV Battery Pack Cover Removed Depower Instructions

1. Connect the **EL-50332-145** Black HV Banana Jack Cable, **EL-50332-150** Red HV Banana Jack Cable, **EL-50332-155** Green HV Banana Jack Cable, and **EL-50332-170** High Voltage Alligator Clamps harness to the applicable battery section/cell module terminals and ground. If depowering all battery sections/cell modules install the manual service disconnect lever.
2. Follow the **EL-50332** on-screen prompts until depower is completed.

NOTE: **Post-crash 50 foot vehicle isolation is no longer required upon successful depower completion.**

3. Remove the manual service disconnect lever.

NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

4. Repair, replace or recycle the hybrid/EV battery pack as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
5. Replace any damaged components noted in the High Voltage Component Inspection before attempting to operate the vehicle.
6. Perform the High Voltage Operation Inspection before attempting to operate the vehicle.

DRIVE MOTOR BATTERY HIGH VOLTAGE MANUAL DISCONNECT LEVER REPLACEMENT

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing**

any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Remove Rear Seat Cushion **Rear Seat Cushion Removal and Installation**

Callout	Component Name

WARNING:

Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING:

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

Preliminary Procedure

1. Remove the drive motor battery. Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)
2. Remove the battery upper cover. Battery Upper Cover Replacement
3. Clean the sealing surface using acetone, toluene or methyl ethyl ketone.

Callout	Component Name
1	Battery Cover Seal Washer **Procedure** If needed, replace the old washer to new one. **NOTE:** **Washers are not included with a new seal.**
2	Battery Cover Seal **NOTE:** **Make sure the seal washers are in battery upper cover bolt holes.**

BATTERY ENERGY CONTROL MODULE REPLACEMENT

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper**

procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Remove the drive motor battery. CELL BATTERY MODULE REPLACEMENT (ROW 1)

Special Tools

EL-48264 Battery Lift Tool

For equivalent regional tools, refer to Special Tools .

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Remove the drive motor battery. Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)
2. Remove the battery upper cover. Battery Upper Cover Replacement

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Remove the drive motor battery. <table>
<tr><th>Callout</th><th>Component Name</th></tr>
<tr><td colspan="2">WARNING:
Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING:
Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:
• Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
• Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
• Visually and functionally inspect the gloves before use.
• Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

Preliminary Procedure
1. Disable the high voltage system. High Voltage Disabling
2. Disconnect the X3 harness connector by rotating the connector handle until 90 degrees.</td></tr>

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Remove the drive motor battery. Callout	Component Name

Callout	Component Name

	WARNING:
	Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.
	
	WARNING:
	Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:
	- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
	- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
	  - **Visually and functionally inspect the gloves before use.**
	  - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**
	
	Failure to follow the procedure exactly as written may result in serious injury or death.
	
	Preliminary Procedure
	1. Remove the drive motor battery. Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)
	2. Remove the battery upper cover. Battery Upper Cover Replacement
	3. Remove the high voltage battery disconnect relay cover. High Voltage Battery Disconnect Relay Replacement

1	High Voltage Battery Disconnect Relay Fuse Nut (Qty: 2) **CAUTION:** Fastener Caution **NOTE:** **Critical high voltage fastener. Perform second torque verification check following re-assembly.** **Procedure** 1. Tighten the nuts to 4.5 N.m (40 lb in). 2. Tighten the nuts to 4.5 N.m (40 lb in) again.
2	High Voltage Battery Disconnect Relay Fuse

DRIVE MOTOR BATTERY POSITIVE AND NEGATIVE CABLE REPLACEMENT

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**

- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. High Voltage Disabling

3. Remove High Voltage Battery Disconnect Relay (3)High Voltage Battery Disconnect Relay Replacement

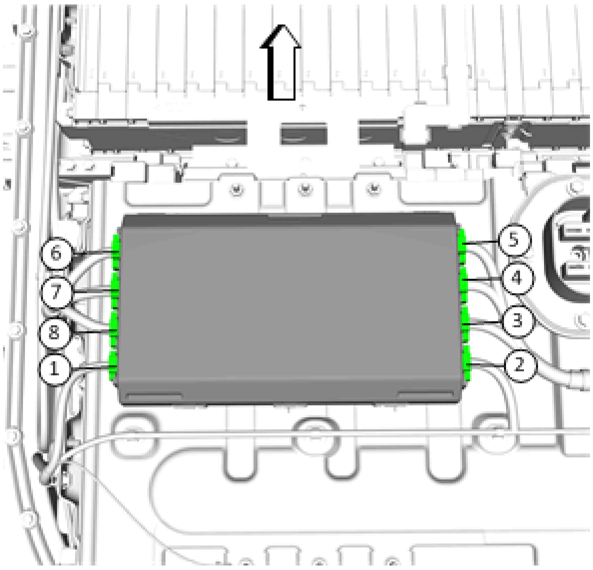

Fig. 213: Battery Energy Control Module Connectors In Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

4. Disconnect the battery energy control module connectors in the sequence shown.

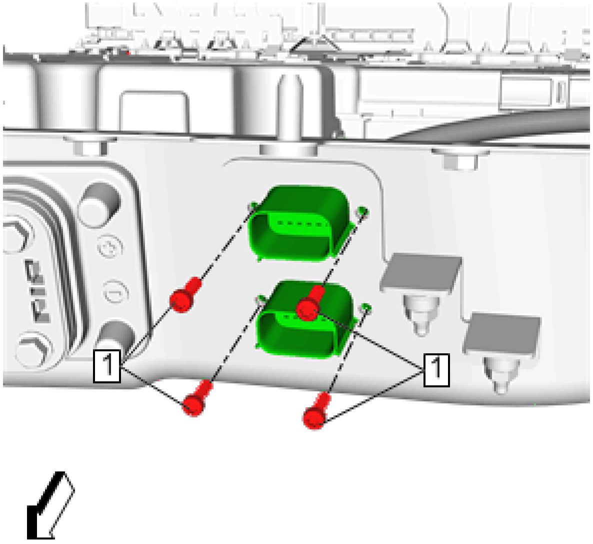

Fig. 214: Fasteners
Courtesy of GENERAL MOTORS COMPANY

5. Remove the fasteners (1)from the wiring harness connector.

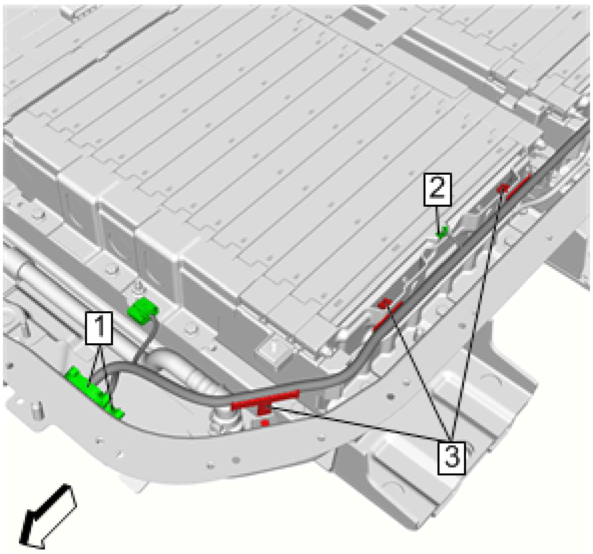

Fig. 215: Drive Motor Battery Control Module Wiring Harness Connectors
Courtesy of GENERAL MOTORS COMPANY

6. Remove the drive motor battery control module wiring harness connectors (1).
7. Remove the battery cell temperature sensor (2) from the battery section.
8. Detach the wiring harness retainers (3).

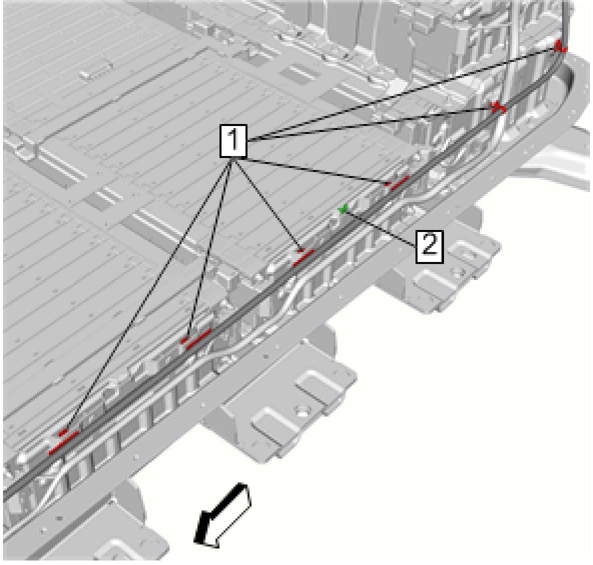

Fig. 216: Wiring Harness Retainers

11. Remove the battery cell temperature sensor (1) from the battery section.
12. Detach the wiring harness retainers (2)
13. Remove the fastener (3) and the wiring harness ground terminal.

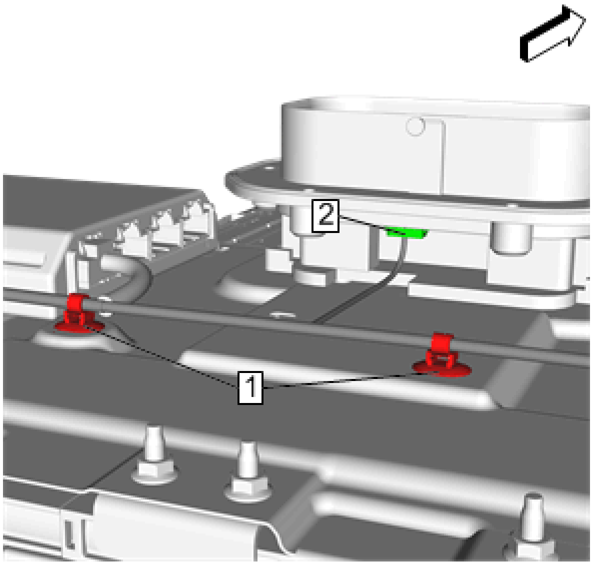

Fig. 218: Wiring Harness Retainers
Courtesy of GENERAL MOTORS COMPANY

14. Detach the wiring harness retainers (1)
15. Disconnect the electrical connector (2) from the high voltage battery high voltage manual disconnect connector. Refer to the below step 16 and 17.

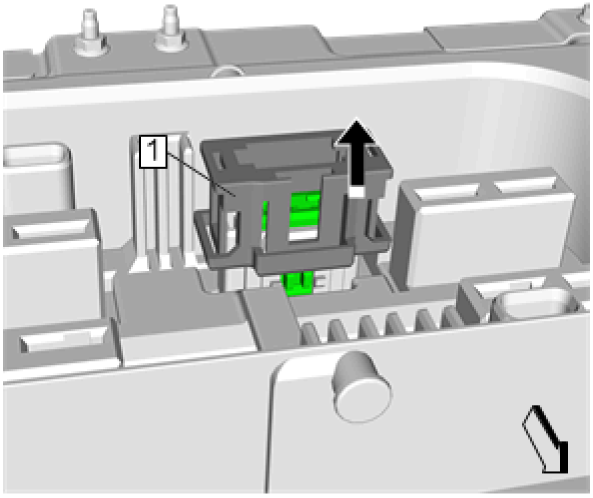

Fig. 219: Connector Guide
Courtesy of GENERAL MOTORS COMPANY

16. Slightly pick up the connector guide (1). Do not need to remove it completely.

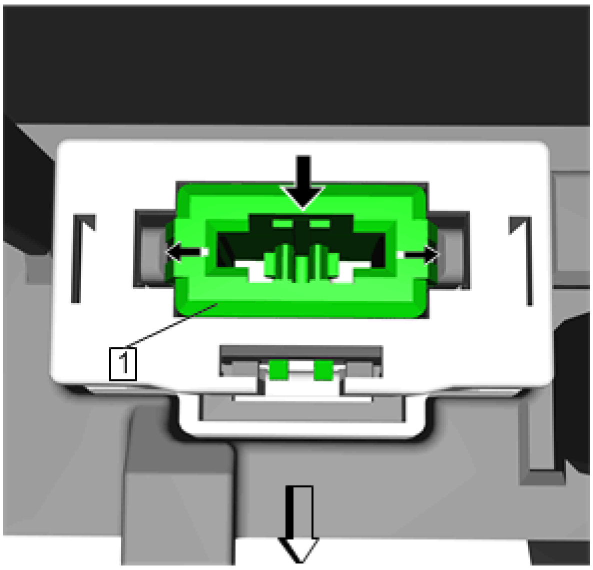

Fig. 220: Connector
Courtesy of GENERAL MOTORS COMPANY

17. While pushing the connector tabs to the side direction, push down the connector (1) and remove it.

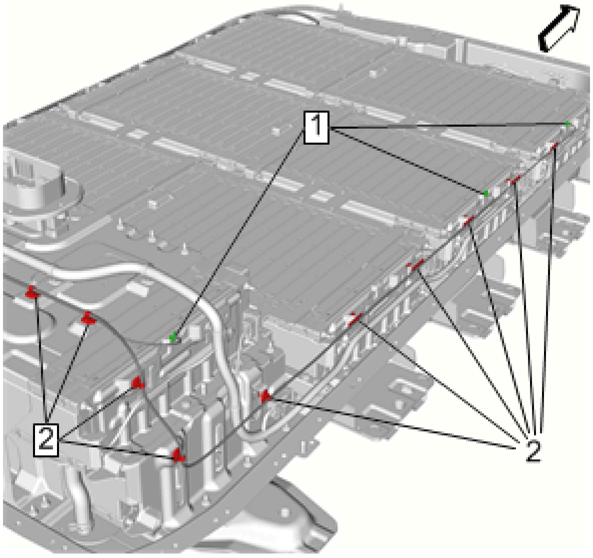

Fig. 221: Battery Cell Temperature Sensors
Courtesy of GENERAL MOTORS COMPANY

18. Remove the battery cell temperature sensors (1) from the battery sections.
19. Detach the wiring harness retainers (2).

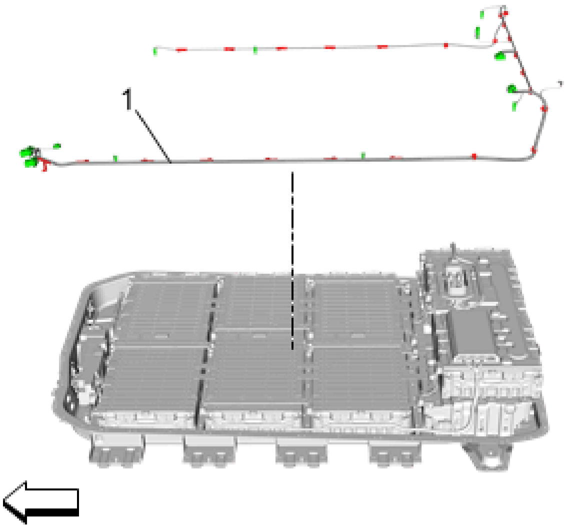

Fig. 222: Drive Motor Battery Control Module Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Note the routing of the harness within the drive motor battery.**

20. Remove the drive motor battery control module wiring harness (1) from the drive motor battery.

Installation Procedure

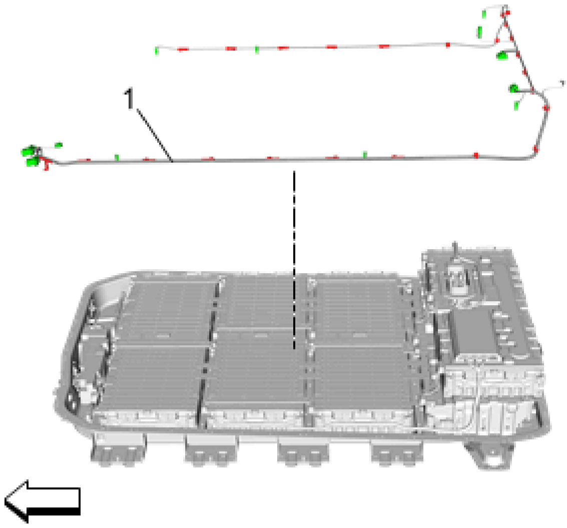

Fig. 223: Drive Motor Battery Control Module Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

1. Install the drive motor battery control module wiring harness (1) to the drive motor battery.

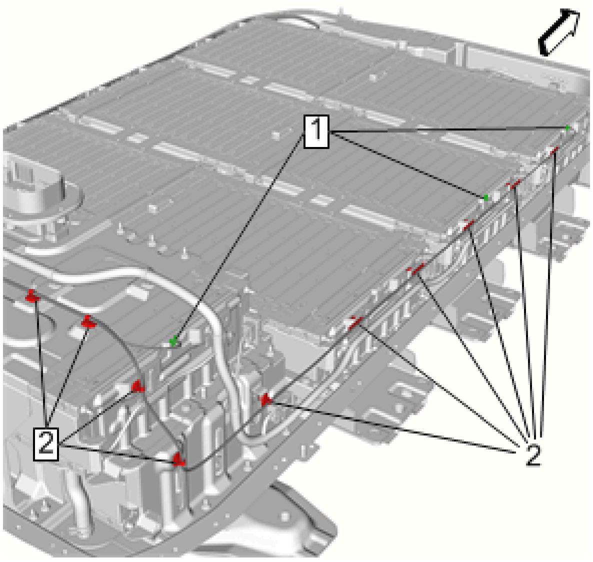

Fig. 224: Battery Cell Temperature Sensors
Courtesy of GENERAL MOTORS COMPANY

2. Install the battery cell temperature sensors (1) into the battery sections.
3. Attach the harness retainers (2) to the bracket.

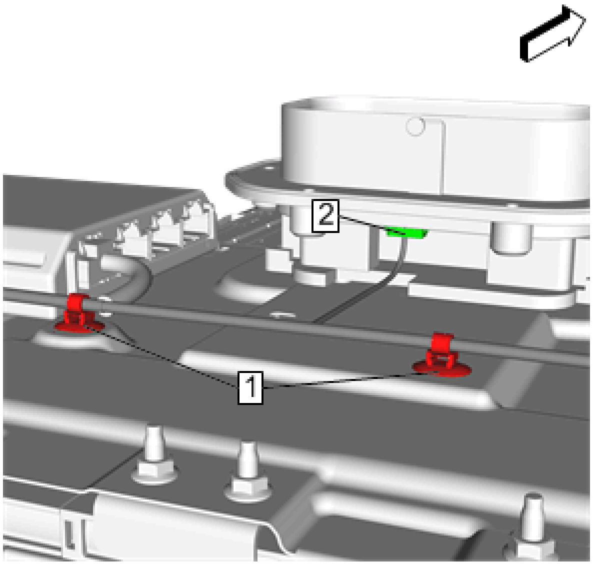

Fig. 225: Wiring Harness Retainers
Courtesy of GENERAL MOTORS COMPANY

4. Connect the electrical connector (2) to the high voltage battery high voltage manual disconnect connector.
5. Attach the harness retainers (1) to the bracket.

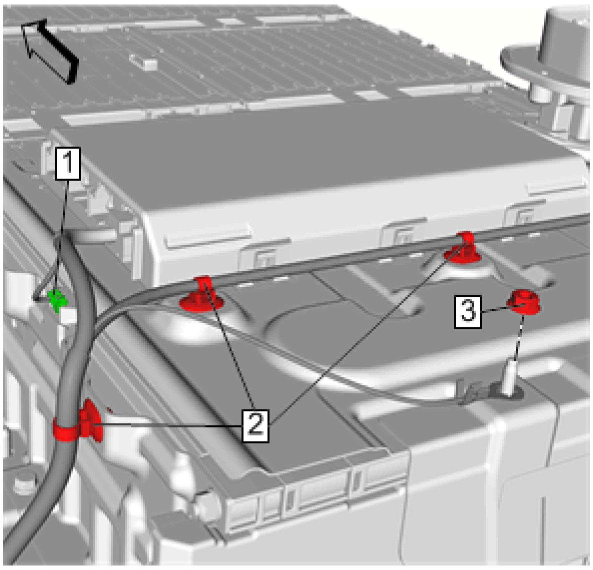

Fig. 226: Battery Cell Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

6. Tighten the drive motor battery control module wiring harness ground terminal nut (3) to 6 N.m (53 lb in).
7. Install the battery cell temperature sensor (1) into the battery section.
8. Attach the harness retainers (2).

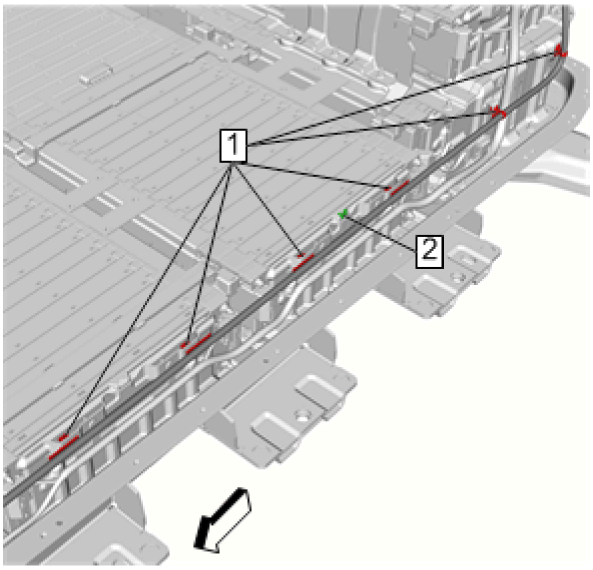

Fig. 227: Wiring Harness Retainers
Courtesy of GENERAL MOTORS COMPANY

9. Install the battery cell temperature sensor (2) into the battery section.
10. Attach the harness retainers (1).

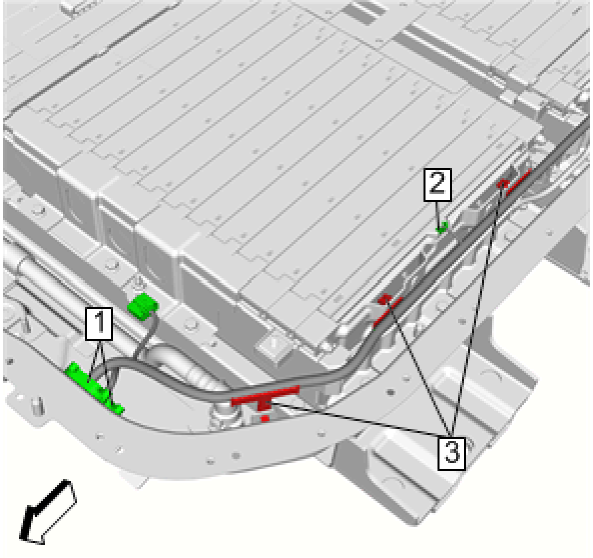

Fig. 228: Drive Motor Battery Control Module Wiring Harness Connectors

Courtesy of GENERAL MOTORS COMPANY

1. Install the drive motor battery sensor module wiring harness (3).
2. Attach the wiring harness retainers (2)
3. Connect the electrical connectors (1)

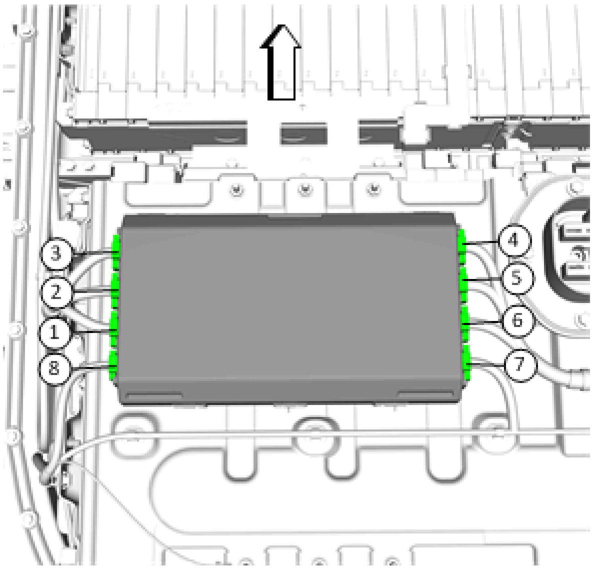

Fig. 239: Battery Energy Control Module Connectors In Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

4. Connect the battery energy control module connectors in the sequence shown to the battery energy control module.
5. Install the battery upper cover. Battery Upper Cover Replacement
6. Install the drive motor battery. For equivalent regional tools, refer to Special Tools .

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

	WARNING:
	Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.
	WARNING:
	Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:
	- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
	- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
	  - **Visually and functionally inspect the gloves before use.**
	  - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**
	Failure to follow the procedure exactly as written may result in serious injury or death.
	Preliminary Procedures
	1. Remove the drive motor battery. Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)

BATTERY CABLE REPLACEMENT (BUS BAR, X3, POSITIVE & NEGATIVE)

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. **High Voltage Disabling**

2. Remove Battery Upper Cover Battery Upper Cover Replacement

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection**

Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. High Voltage Disabling
2. Remove the front compartment air deflector. Front Compartment Air Deflector Replacement
3. Drain the drive motor battery cooling system. Drive Motor Battery Cooling System Draining and Filling

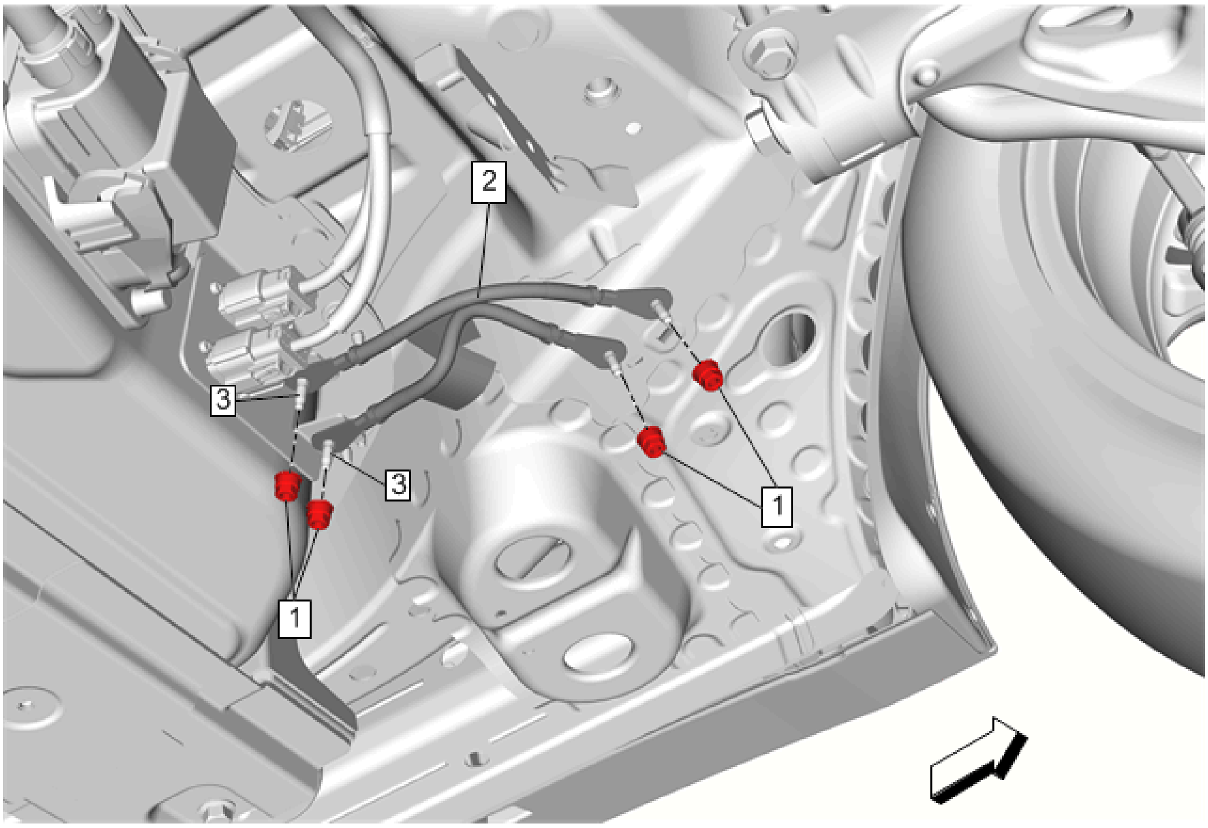

Fig. 287: Battery Negative Cable
Courtesy of GENERAL MOTORS COMPANY

4. Remove the battery negative cable (2) from the high voltage battery and body structure. Battery Negative Cable Replacement (High Voltage Battery to Body Structure) Battery Negative Cable Replacement (12V Battery to Body Structure)

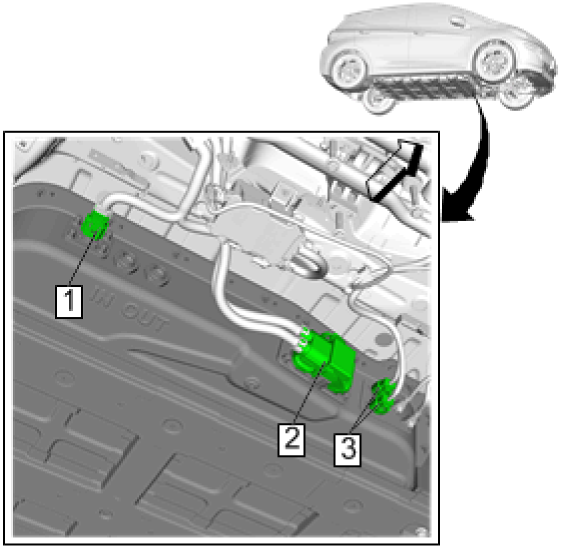

Fig. 288: High Voltage Battery Connector
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the X4 high voltage battery connector (1) from the drive motor battery.
6. Disconnect the X3 high voltage battery connector (2) from the drive motor battery by rotating the connector handle until 90 degrees.
7. Disconnect the body wiring harness connectors (3) from the drive motor battery.

WARNING: **To avoid any vehicle damage, serious personal injury or death:**

- **When major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.**
- **When performing work in the engine compartment or under the vehicle, ensure that the hood is fully open, or opened to its secondary latch. When the hood is opened to the secondary latch, the vehicle will disable the remote start features from the key fob and OnStar mobile app. Failure to open the hood, or open the hood to the secondary latch while doing a repair in the engine compartment or under the vehicle can result in inadvertent vehicle starting which could result in personal injury or damage to a vehicle.**

CAUTION: **Perform the following steps before beginning any vehicle lifting or jacking procedure:**

- **Remove or secure all of the vehicle contents in order to avoid any shifting or any movement that may occur during the vehicle lifting or jacking procedure.**
- **The lifting equipment or the jacking equipment weight rating must meet or exceed the weight of the vehicle and any vehicle contents.**
- **The lifting equipment or the jacking equipment must meet the operational standards of the lifting equipment or jacking equipment manufacturer.**
- **Perform the vehicle lifting or jacking procedure on a clean, hard, dry, level surface.**
- **Perform the vehicle lifting or jacking procedure only at the identified lift points. DO NOT allow the lifting equipment or jacking equipment to contact any other vehicle components.**

Failure to perform the previous steps could result in damage to the lifting equipment or the jacking equipment, the vehicle, and/or the vehicle contents.

8. During drive motor battery removal, vehicle weight will be redistributed and may cause the vehicle to become unstable on the hoist. To avoid the vehicle potentially falling off secure the vehicle to lift/hoist arms with straps.

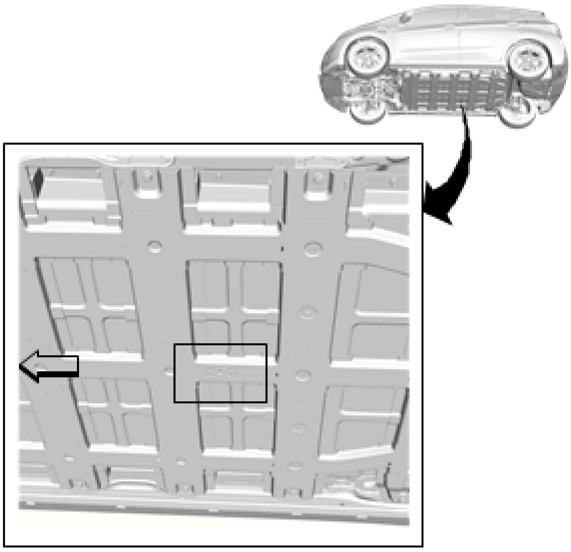

Fig. 289: Lifting Table
Courtesy of GENERAL MOTORS COMPANY

NOTE: **There is C.G (Center of Gravity) mark on the drive motor battery tray to locate your lift table.**

NOTE: **The high voltage battery mass is approximately 450 kg (1000 lbs)**

9. Position a **GE-52418** Lifting Table or **GE-52200** Lifting Table and raise the lifting table into position.

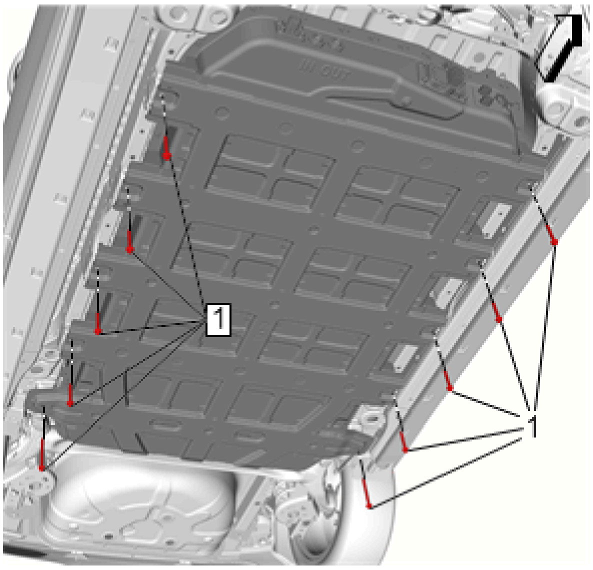

Fig. 290: Drive Motor Battery Mounting Fasteners
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Verify ALL connectors are removed from the drive motor battery.**

NOTE: **Confirm the locking MSD cap/cover required in some regions will pass through the vehicle floor panel. If not, the MSD cap/cover should be removed during Battery Pack lowering from vehicle then reinstalled once the pack is out.**

NOTE: **Ensure all fasteners are removed before lowering the support table fixture with the drive motor battery.**

10. Remove the drive motor battery mounting fasteners (1).

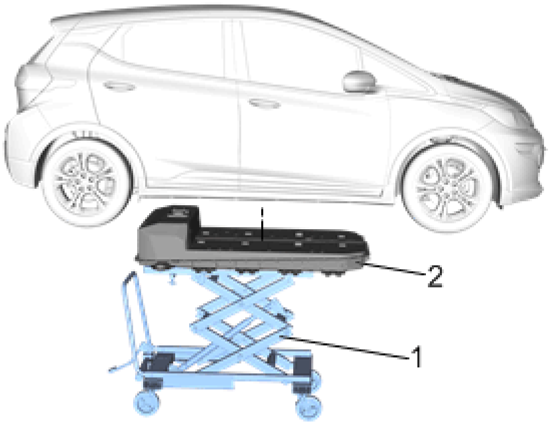

Fig. 291: Lifting Table With Drive Motor Battery
Courtesy of GENERAL MOTORS COMPANY

WARNING: **When removing the high voltage battery, only use the recommended lift table with straps capable of holding 1000kg (2204.62 lbs). Failure to use the appropriate lift table and straps could cause the battery to fall and may result in personal injury or death.**

11. Slowly lower the lifting table (1) with the drive motor battery (2).
12. Secure the high voltage battery to the lifting table with straps.
13. Cover the manual disconnect tape.

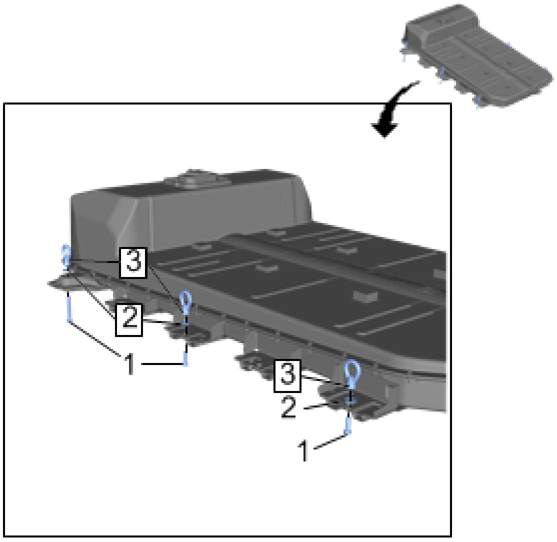

Fig. 292: 3 Eye-Nut, Washer And Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Using the **EL-51102 - 20** High Voltage Battery Lift Bar Tilter Eye-Nut Kit install the 3 eye-nut (3), washers (2) and bolts (1). Tighten the bolts (1) to 9 N.m (80 lb in).

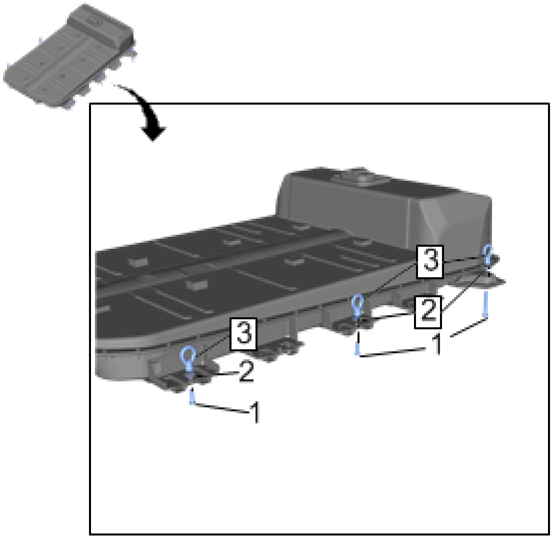

Fig. 293: 3 Eye-Nut, Washer And Bolts
Courtesy of GENERAL MOTORS COMPANY

15. Using the **EL-51102 - 20** High Voltage Battery Lift Bar Tilter Eye-Nut Kit install the 3 eye-nut (3), washers (2) and bolts (1). Tighten the bolts (1) to 9 N.m (80 lb in).

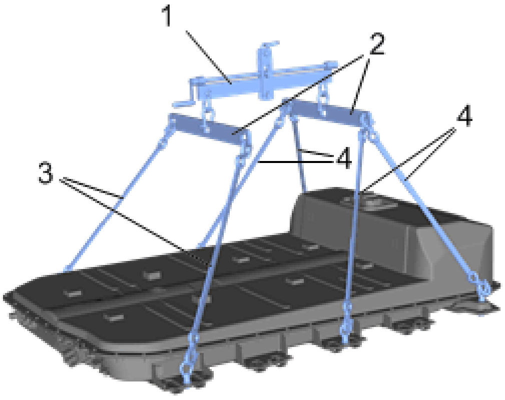

Fig. 294: High Voltage Battery Lift Bar Tilter
Courtesy of GENERAL MOTORS COMPANY

16. Attach the **EL-51102** High Voltage Battery Lift Bar Tilter (1) to a suitable lifting crane.
17. Position the **EL-51102** High Voltage Battery Lift Bar Tilter and **EL-51102 - 10** Hanging Bars and Shackles (2) over the high voltage battery as shown.
18. Install the **EL-51102 - 40** Battery Lifting Strap (3) and the **EL-51102 - 50** Battery Lifting Strap (4) to transport the drive motor battery to a secure area.

NOTE: **Make sure the drive motor battery is balanced when hung from the lifting straps before moving with a crane or chain block to a support table.**

NOTE: **As part of the battery removal process, all coolant should be drained from the battery pack.**

NOTE: **If internal repairs are being performed on the battery, all coolant should be drained from the battery pack to ensure coolant does not drain from the hoses during repairs.**

19. Install 2 coolant plugs into the coolant lines. Coolant plugs can be removed from the NEW service battery assembly.

Installation Procedure

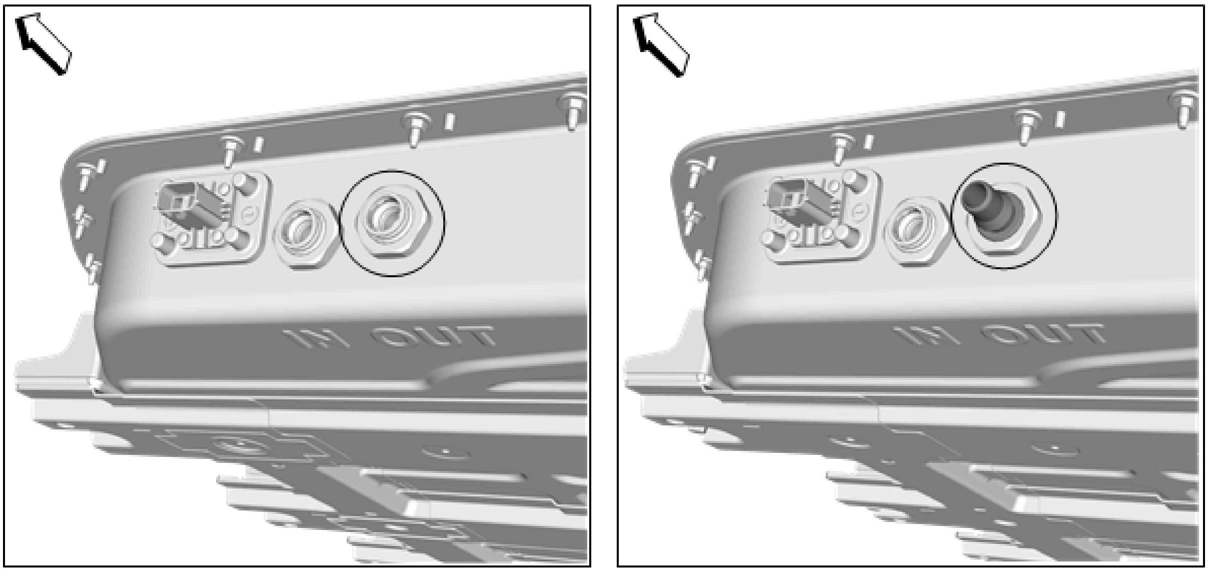

Fig. 295: New/ Old Battery Versions
Courtesy of GENERAL MOTORS COMPANY

1. Check if the drive motor battery pack is OLD version battery or NEW version battery.

    1.1 OLD version battery has a female type battery cooler outlet port like upper left picture.

    1.2 NEW version battery has a male type battery cooler outlet port like upper right picture.

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

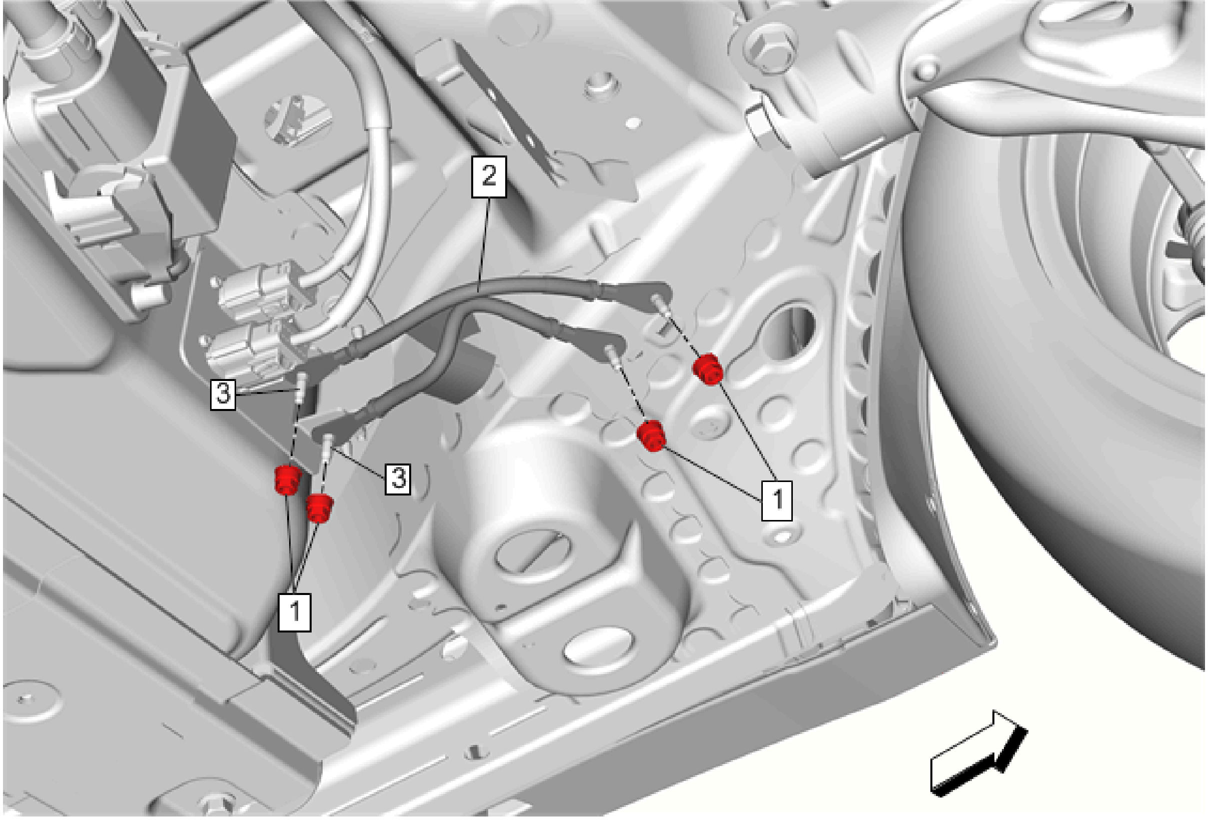
- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

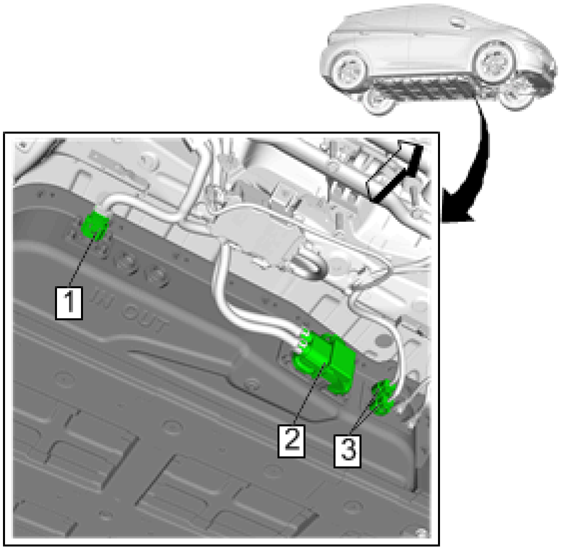
Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. **High Voltage Disabling**
2. Remove the front compartment air deflector. **Front Compartment Air Deflector Replacement**
3. Drain the drive motor battery cooling system. **Drive Motor Battery Cooling System Draining and Filling**



[**Fig. 301: Battery Negative Cable**](#)
Courtesy of GENERAL MOTORS COMPANY

4. Remove the battery negative cable (2) from the high voltage battery and body structure. [**Battery Negative Cable Replacement (High Voltage Battery to Body Structure)**](#) [**Battery Negative Cable Replacement (12V Battery to Body Structure)**](#)



[**Fig. 302: High Voltage Battery Connector**](#)

5. Disconnect the X4 high voltage battery connector (1) from the drive motor battery.
6. Disconnect the X3 high voltage battery connector (2) from the drive motor battery by rotating the connector handle until 90 degrees.
7. Disconnect the body wiring harness connectors (3) from the drive motor battery.

WARNING: **To avoid any vehicle damage, serious personal injury or death:**

- **When major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.**

- **When performing work in the engine compartment or under the vehicle, ensure that the hood is fully open, or opened to its secondary latch. When the hood is opened to the secondary latch, the vehicle will disable the remote start features from the key fob and OnStar mobile app. Failure to open the hood, or open the hood to the secondary latch while doing a repair in the engine compartment or under the vehicle can result in inadvertent vehicle starting which could result in personal injury or damage to a vehicle.**

CAUTION: **Perform the following steps before beginning any vehicle lifting or jacking procedure:**

- **Remove or secure all of the vehicle contents in order to avoid any shifting or any movement that may occur during the vehicle lifting or jacking procedure.**
- **The lifting equipment or the jacking equipment weight rating must meet or exceed the weight of the vehicle and any vehicle contents.**
- **The lifting equipment or the jacking equipment must meet the operational standards of the lifting equipment or jacking equipment manufacturer.**
- **Perform the vehicle lifting or jacking procedure on a clean, hard, dry, level surface.**
- **Perform the vehicle lifting or jacking procedure only at the identified lift points. DO NOT allow the lifting equipment or jacking equipment to contact any other vehicle components.**

Failure to perform the previous steps could result in damage to the lifting equipment or the jacking equipment, the vehicle, and/or the vehicle contents.

8. During drive motor battery removal, vehicle weight will be redistributed and may cause the vehicle to become unstable on the hoist. To avoid the vehicle potentially falling off secure the vehicle to lift/hoist arms with straps.

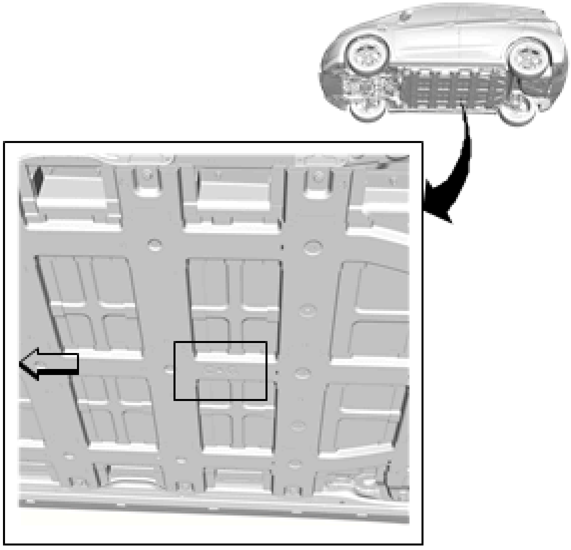

Fig. 303: Lifting Table

21. Clear the secured high voltage DTCs. **Clear Secured High Voltage DTCs**
22. If required, perform the battery Hybrid/EV battery pack capacity learn procedure. **Hybrid/EV Battery Pack Capacity Learn**

NOTE: **Refer to Diagnostic Aids to determine when, if required procedure should be performed.**

DRIVE MOTOR BATTERY REPLACEMENT AND SHIPPING PREPARATION (NEW DESIGN BATTERY PACK IN VEHICLES BUILT AFTER 1G1FX6S06H4163254)

Special Tools

- **GE-52418** Lifting Table
- **GE-52200** Lifting Table
- **EL-51102** High Voltage Battery Lift Bar Tilter
- **EL-51102 - 10** Hanging Bars and Shackles
- **EL-51102 - 20** High Voltage Battery Lift Bar Tilter Eye-Nut Kit
- **EL-51102 - 40** Battery Lifting Strap
- **EL-51102 - 50** Battery Lifting Strap

For equivalent regional tools, refer to Special Tools .

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. High Voltage Disabling
2. Remove the front compartment air deflector. Front Compartment Air Deflector Replacement
3. Drain the drive motor battery cooling system. Drive Motor Battery Cooling System Draining and Filling

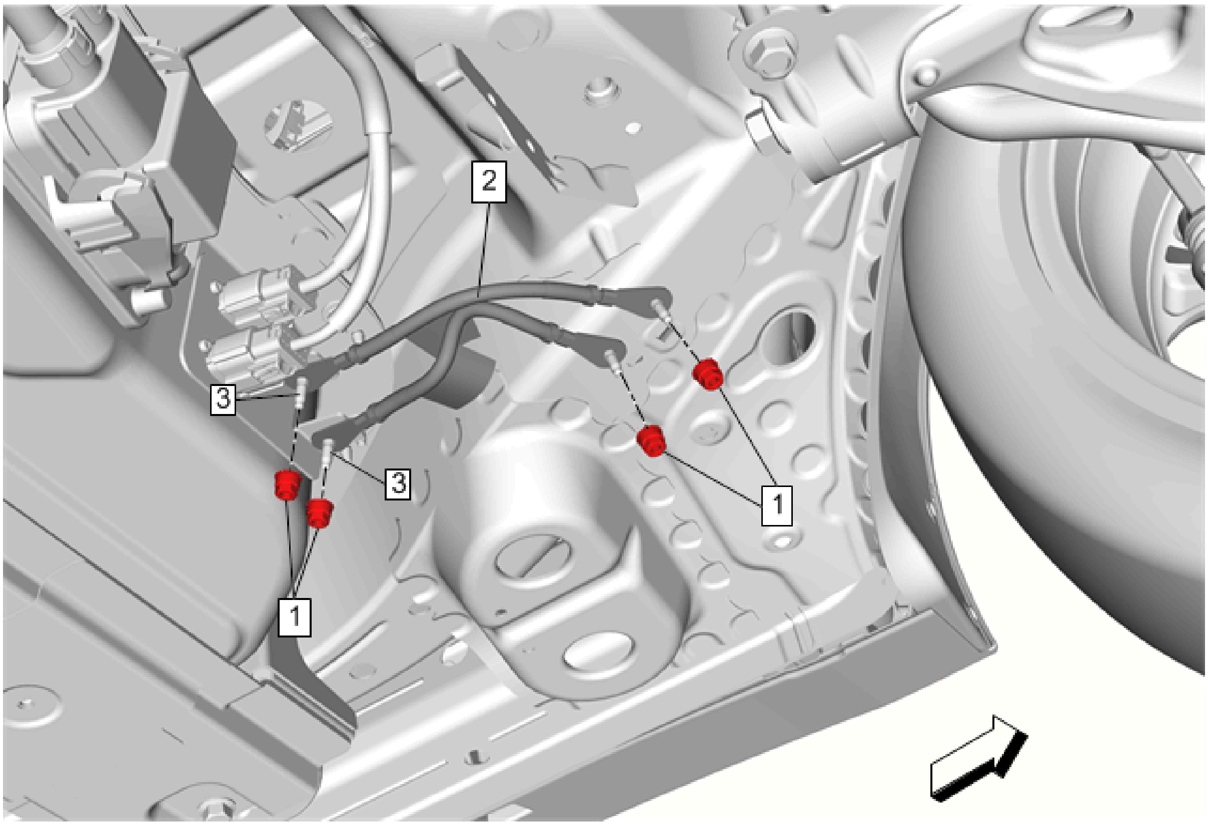

Fig. 316: Battery Negative Cable
Courtesy of GENERAL MOTORS COMPANY

4. Remove the battery negative cable (2) from the high voltage battery and body structure. Battery Negative Cable Replacement (High Voltage Battery to Body Structure) Battery Negative Cable Replacement (12V Battery to Body Structure)

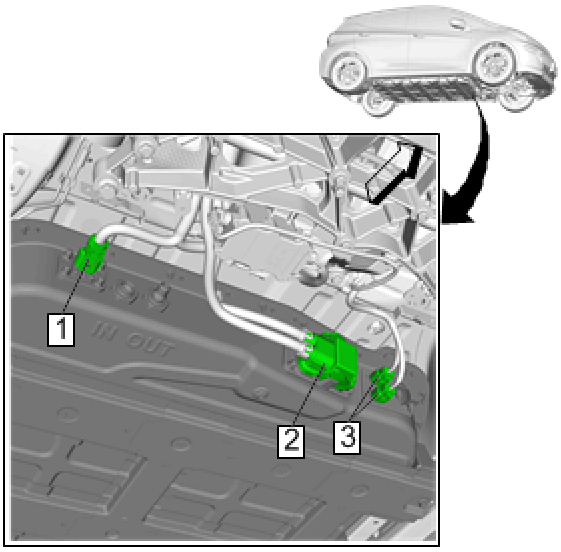

Fig. 317: Body Wiring Harness Connectors And High Voltage Connector
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the X4 high voltage battery connector (1) from the drive motor battery.
6. Disconnect the X3 high voltage battery connector (2) from the drive motor battery by rotating the connector handle until 90 degrees.
7. Disconnect the body wiring harness connectors (3) from the drive motor battery.

WARNING: **To avoid any vehicle damage, serious personal injury or death:**

- **When major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.**
- **When performing work in the engine compartment or under the vehicle, ensure that the hood is fully open, or opened to its secondary latch. When the hood is opened to the secondary latch, the vehicle will disable the remote start features from the key fob and OnStar mobile app. Failure to open the hood, or open the hood to the secondary latch while doing a repair in the engine compartment or under the vehicle can result in inadvertent vehicle starting which could result in personal injury or damage to a vehicle.**

CAUTION: **Perform the following steps before beginning any vehicle lifting or jacking procedure:**

- **Remove or secure all of the vehicle contents in order to avoid any shifting or any movement that may occur during the vehicle lifting or jacking procedure.**
- **The lifting equipment or the jacking equipment weight rating must meet or exceed the weight of the vehicle and any vehicle contents.**
- **The lifting equipment or the jacking equipment must meet the operational standards of the lifting equipment or jacking equipment manufacturer.**
- **Perform the vehicle lifting or jacking procedure on a clean, hard, dry, level surface.**

- **Perform the vehicle lifting or jacking procedure only at the identified lift points. DO NOT allow the lifting equipment or jacking equipment to contact any other vehicle components.**

Failure to perform the previous steps could result in damage to the lifting equipment or the jacking equipment, the vehicle, and/or the vehicle contents.

8. During drive motor battery removal, vehicle weight will be redistributed and may cause the vehicle to become unstable on the hoist. To avoid the vehicle potentially falling off secure the vehicle to lift/hoist arms with straps.

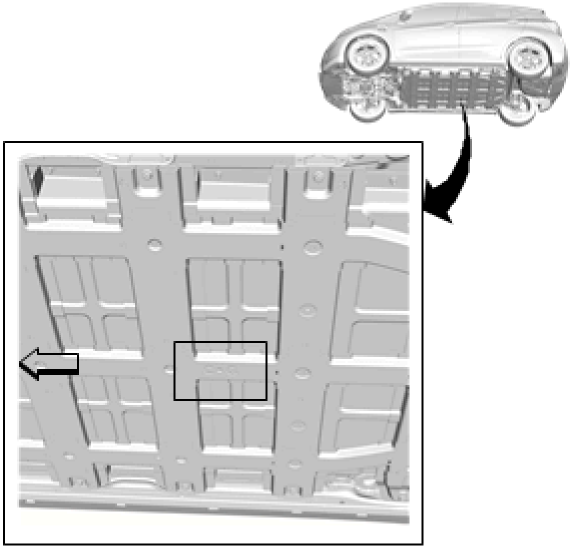

Fig. 318: Lifting Table
Courtesy of GENERAL MOTORS COMPANY

NOTE: **There is C.G (Center of Gravity) mark on the drive motor battery tray to locate your lift table.**

NOTE: **The high voltage battery mass is approximately 450 kg (1000 lbs)**

9. Position a **GE-52418** Lifting Table or **GE-52200** Lifting Table and raise the lifting table into position.

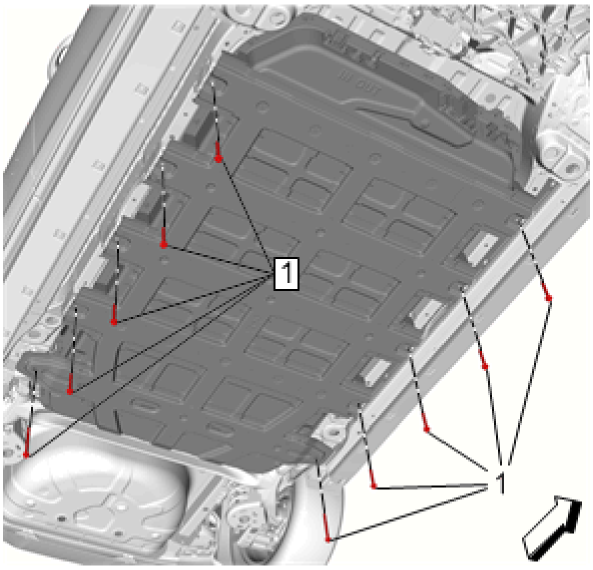

Fig. 319: Outside Mounting Fasteners
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Verify ALL connectors are removed from the drive motor battery.**

NOTE: **Confirm the locking MSD cap/cover required in some regions will**

pass through the vehicle floor panel. If not, the MSD cap/cover should be removed during Battery Pack lowering from vehicle then reinstalled once the pack is out.

NOTE: **Ensure all fasteners are removed before lowering the support table fixture with the drive motor battery.**

10. Remove the drive motor battery mounting fasteners (1).

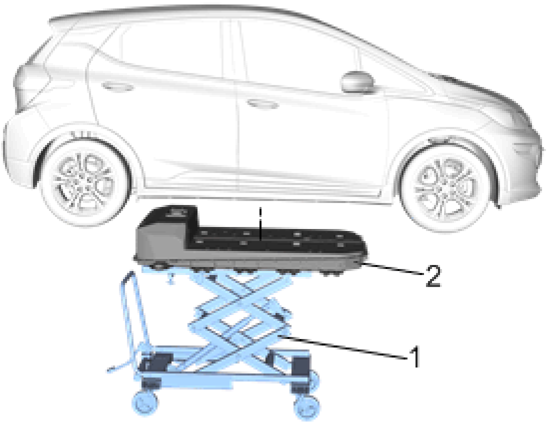

Fig. 320: Lifting Table With Drive Motor Battery
Courtesy of GENERAL MOTORS COMPANY

WARNING: **When removing the high voltage battery, only use the recommended lift table with straps capable of holding 1000kg (2204.62 lbs). Failure to use the appropriate lift table and straps could cause the battery to fall and may result in personal injury or death.**

11. Slowly lower the lifting table (1) with the drive motor battery (2).
12. Secure the high voltage battery to the lifting table with straps.
13. Cover the manual disconnect tape.

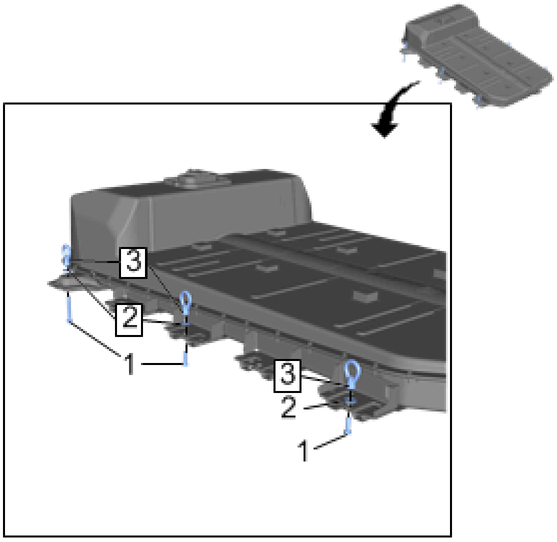

Fig. 321: 3 Eye-Nut, Washer And Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Using the **EL-51102 - 20** High Voltage Battery Lift Bar Tilter Eye-Nut Kit install the 3 eye-nut (3), washers (2) and bolts (1). Tighten the bolts (1) to 9 N.m (80 lb in).

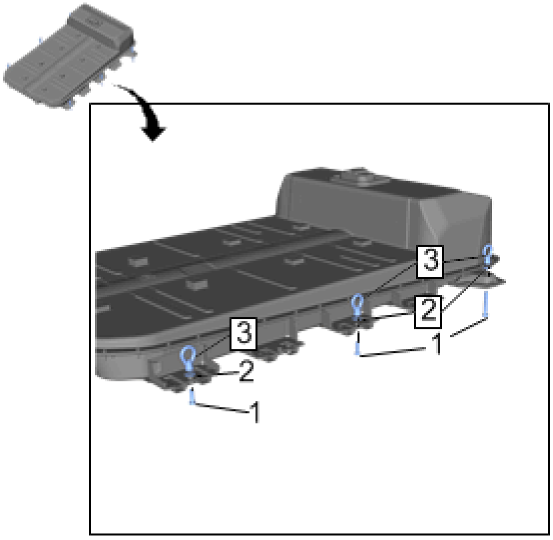

Fig. 322: 3 Eye-Nut, Washer And Bolts
Courtesy of GENERAL MOTORS COMPANY

15. Using the **EL-51102 - 20** High Voltage Battery Lift Bar Tilter Eye-Nut Kit install the 3 eye-nut (3), washers (2) and bolts (1). Tighten the bolts (1) to 9 N.m (80 lb in).

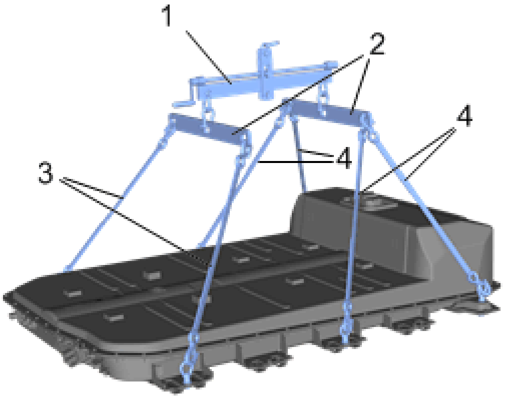

Fig. 323: High Voltage Battery Lift Bar Tilter
Courtesy of GENERAL MOTORS COMPANY

16. Attach the **EL-51102** High Voltage Battery Lift Bar Tilter (1) to a suitable lifting crane.
17. Position the **EL-51102** High Voltage Battery Lift Bar Tilter and **EL-51102 - 10** Hanging Bars and Shackles (2) over the high voltage battery as shown.
18. Install the **EL-51102 - 40** Battery Lifting Strap (3) and the **EL-51102 - 50** Battery Lifting Strap (4) to transport the drive motor battery to a secure area.

NOTE: **Make sure the drive motor battery is balanced when hung from the lifting straps before moving with a crane or chain block to a support table.**

NOTE: **As part of the battery removal process, all coolant should be drained from the battery pack.**

NOTE: **If internal repairs are being performed on the battery, all coolant should be drained from the battery pack to ensure coolant does not drain from the hoses during repairs.**

19. Install 2 coolant plugs into the coolant lines. Coolant plugs can be removed from the NEW service battery assembly.

Installation Procedure

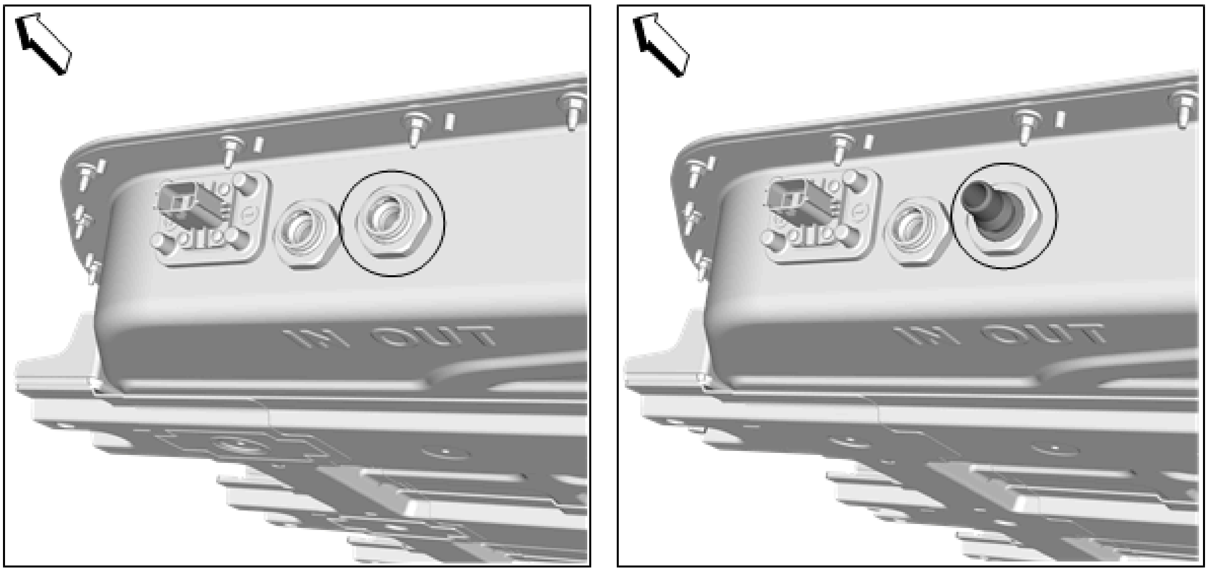

Fig. 324: New/ Old Battery Versions
Courtesy of GENERAL MOTORS COMPANY

1. Check if the drive motor battery pack is OLD version battery or NEW version battery.

   1.1 OLD version battery has a female type battery cooler outlet port like upper left picture.

   1.2 NEW version battery has a male type battery cooler outlet port like upper right picture.

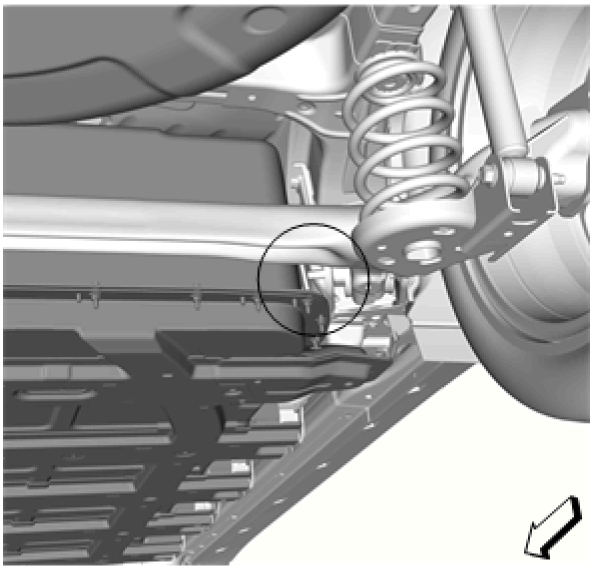

Fig. 325: Rear Of Drive Motor Battery And Rear Suspension Bushing Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Avoid making contact between the rear of the drive motor battery and the rear suspension bushing bolts.

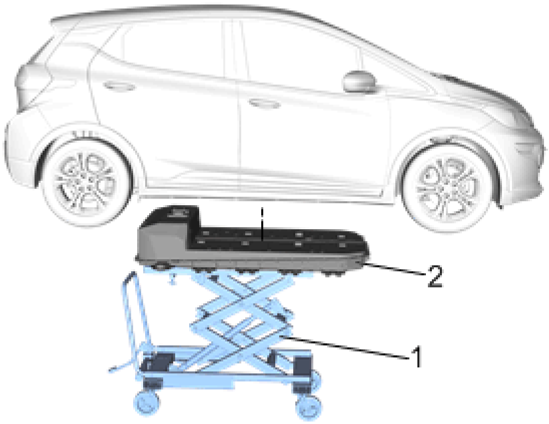

Fig. 326: Lifting Table With Drive Motor Battery
Courtesy of GENERAL MOTORS COMPANY

3. Secure high voltage battery to the lifting table with straps.
4. With the drive motor battery (2) on the **GE-52418** Lifting Table or **GE-52200** Lifting Table (1), slowly raise the lifting table.
5. Release the straps.

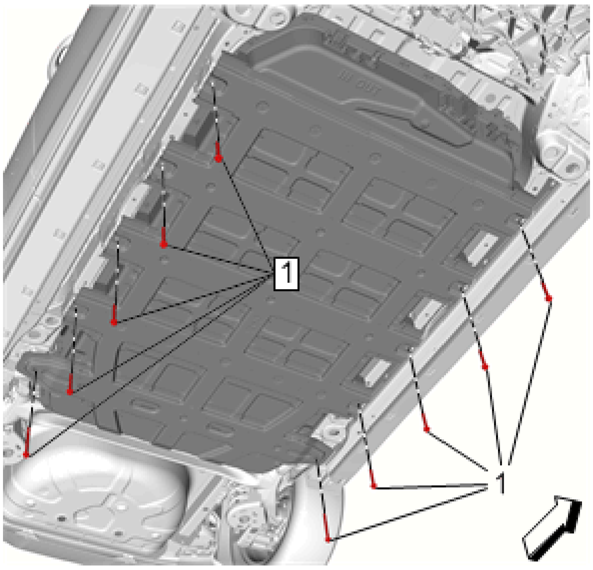

Fig. 327: Outside Mounting Fasteners
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

6. Snugly tighten the outside mounting fasteners (1).
7. Lower the lifting table.
8. Tighten the fasteners (1) to 56 N.m (41 lb ft).

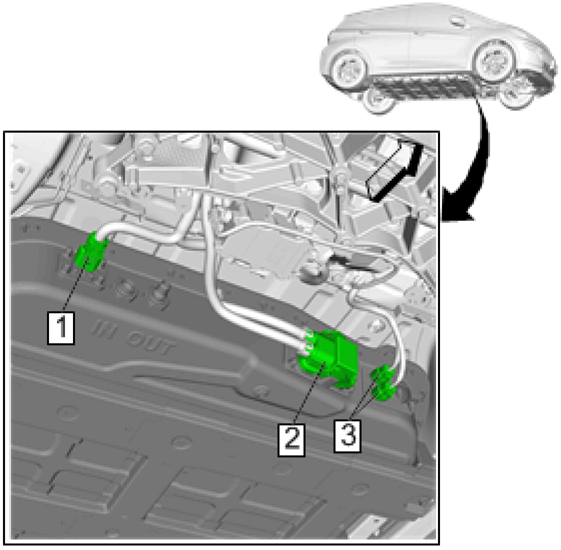

Fig. 328: Body Wiring Harness Connectors And High Voltage Connector
Courtesy of GENERAL MOTORS COMPANY

9. Connect the body wiring harness connectors (3) to the drive motor battery.
10. Connect the X3 high voltage connector (2) to the drive motor battery.
11. Connect the X4 high voltage connector (1) to the drive motor battery.

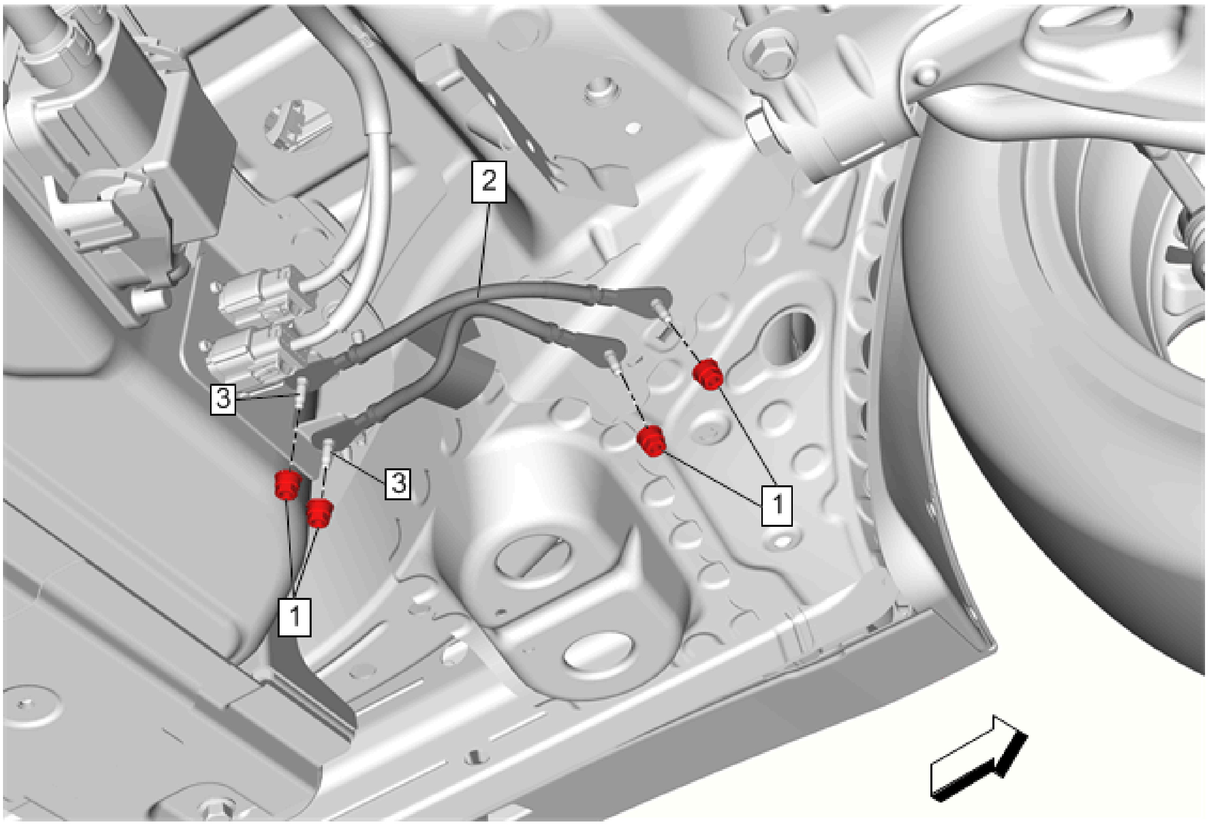

Fig. 329: Battery Negative Cable
Courtesy of GENERAL MOTORS COMPANY

12. Install the battery negative cable (2) to the high voltage battery and body structure. **Battery Negative Cable Replacement (High Voltage Battery to Body Structure)** **Battery Negative Cable Replacement (12V Battery to Body Structure)**
13. Untie the straps that is installed to avoid the vehicle potentially falling off from the lift/hoist.
14. Fill the drive motor battery cooling system. **Drive Motor Battery Cooling System Draining and Filling**
15. Check the cooling system for leaks. **Hybrid Cooling System Leak Test**
16. Install the front compartment air deflector. **Front Compartment Air Deflector Replacement**
17. Enable the high voltage system. **High Voltage Enabling**

18. Reprogram the battery energy control module. **Battery Energy Control Module Programming and Setup**
19. Program the hybrid powertrain control module 2. **Hybrid Powertrain Control Module 2 Programming and Setup**
20. Clear the secured high voltage DTCs. **Clear Secured High Voltage DTCs**
21. If required, perform the battery Hybrid/EV battery pack capacity learn procedure. **Hybrid/EV Battery Pack Capacity Learn**

NOTE: **Refer to Diagnostic Aids to determine when, if required procedure should be performed.**

CLEAR SECURED HIGH VOLTAGE DTCS

Circuit/System Description

The hybrid powertrain control modules 1 and 2 independently monitor for high voltage safety conditions such as airbag deploy events and certain high voltage system faults. When either module identifies one of these conditions, a DTC may set and the vehicle is placed into a 'high voltage lockout' state. While in the lockout state, the high voltage contactor relays are prevented from closing.

The purpose of the high voltage lockout state is to allow for high voltage system inspection prior to re-enabling. A complete inspection of the high voltage system and components must be performed if the vehicle has been involved in a collision. Perform the **High Voltage System Inspection** procedure, if necessary, prior to clearing a Secured High Voltage DTCs/lockout state.

Diagnostic Aids

- The following conditions may result in a HV lockout state without a corresponding DTC:
    - High voltage component replacement
    - Low 12 V battery event
    - SPS programming event
    - Airbag deployment/crash event detected: The Inflatable Restraint Sensing and Diagnostic Module may or may not set a DTC but will continue to broadcast a crash event status until reset.
- Performing a scan tool DTC Clear may clear the diagnostic that set the HV lockout state, but will not reset the lockout.
- Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.
- The Clear Secured High Voltage DTCs procedure must be completed when the following components, as applicable, are replaced:
    - K16 Hybrid/EV Battery Energy Control Module
    - K112A - K112H Hybrid/EV Battery Interface Control Module
    - A4 Hybrid/EV Battery Pack
    - K114A Hybrid/EV Powertrain Control Module 1
    - K114B Hybrid/EV Powertrain Control Module 2

Contactor Open Reasons Reset

The hybrid/EV powertrain control module 2, Hybrid/EV Battery Contactor Open Reasons scan tool parameter list identifies all past events that commanded contactors open. The parameters can only be reset by either reprogramming the hybrid/EV powertrain control module 2 or by performing the scan tool Hybrid/EV Battery Contactor Open Reasons Reset function. To aid in possible future intermittent diagnosis, the parameters should be reset to NO once all diagnostic procedures are successfully completed.

Scan Tool Hybrid/EV Battery Contactor Open Reasons Reset Function

NOTE: **The hybrid/EV system must be able to enter a Propulsion Active state.**

1. Complete the Circuit System Verification and Testing as necessary.
2. Remove any chargers and as applicable, the charge cord.
3. Vehicle OFF, wait 5 minutes.

NOTE: **It is not necessary to completely remove the S15 Manual Service Disconnect.**

4. Disengage the S15 Manual Service Disconnect to the first position to open the high voltage interlock loop circuit.
5. Service Mode, enable the scan tool reset function.
6. Vehicle OFF, wait 5 minutes.
7. Fully engage the S15 Manual Service Disconnect.
8. Start the vehicle and Clear Vehicle DTCs.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Vehicle ON.
2. With a scan tool, verify the Hybrid/EV Powertrain Control Module 2 parameters Hybrid/EV Battery Positive Contactor Command and Hybrid/EV Battery Negative Contactor Command each indicate Closed.
    - **If the contactors are not commanded Closed**

      Refer to Circuit/System Testing.

    - **If the contactors are commanded Closed**
3. A Secured High Voltage DTC HV lockout state is not present. All OK.

Circuit/System Testing

The Clear Secured High Voltage DTCs reset process requires scan tool interaction with **two or three different control modules in sequence** and can be completed using the following steps:

1. Install **EL-49642** SPS programming support tool.
2. Vehicle in Service Mode. With a scan tool select the Hybrid/EV Powertrain Control Module 2, Hybrid Battery Pack Contactor Open Reasons data list. Verify if either the Crash Event Detected or Air Bag Deployed parameters indicate YES.
    - **If either parameter displays YES**
    1. Perform the **High Voltage System Inspection** procedure.
    2. If the results of the inspection procedure support enabling of the high voltage system, perform the Inflatable Restraint and Sensing Diagnostic Module function Reset High Voltage Disable Request After Crash Event Detected.
    3. Turn the vehicle OFF for 5 minutes.
    4. Proceed to next step.
    - **If BOTH parameters indicate NO**
3. Vehicle in Service Mode. With a scan tool, clear All DTCs.

NOTE: **A command reject may appear on the scan tool after the first Clear Secured High Voltage DTCs request. If this occurs, ignore this command reject and continue to the next step.**

4. With a scan tool, select Hybrid/EV Powertrain Control Module 2 Control Functions list. Select Clear Secured High Voltage DTCs and follow the on-screen instructions waiting 45 seconds before exiting the screen.
5. With a scan tool, select Hybrid/EV Powertrain Control Module Control Functions list. Select Clear Secured High Voltage DTCs. Select Continue button waiting 45 seconds before exiting the screen.
6. With a scan tool, select Hybrid/EV Powertrain Control Module 2 Control Functions list. Select Clear Secured High Voltage DTCs and follow the on-screen instructions.
7. With a scan tool, clear All DTCs.
8. Allow the Hybrid/EV powertrain Control Modules to enter sleep mode by performing the following:
    1. Turn the vehicle OFF.
    2. Ensure the scan tool is not communicating with any control modules by returning to the Home screen.
    3. Ensure the scan tool is accessible without having to open doors or otherwise cause control module wake-up.
    4. Shut all doors. Do NOT depress the brake pedal or activate any vehicle controls such as the parking lights, fuel door release, etc.

       NOTE: **Sleep mode is usually entered within two minutes after shutting off the vehicle. However, activating vehicle features such as Refuel Mode may extend this time up to 30 minutes.**

    5. Wait 5 minutes with the vehicle in the prescribed condition so that the modules may enter sleep mode.
9. With a scan tool, verify the Hybrid/EV Powertrain Control Module 2 has gone to sleep by ensuring communication is not present.
    - **If communication is present**

      Repeat the previous step.

    - **If communication is not present**
10. Start the vehicle.
11. Verify that no DTCs are set.
    - **If any DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no DTCs are set**
12. All OK.

HYBRID/EV BATTERY PACK CAPACITY LEARN

Circuit/System Description

The Hybrid Powertrain Control Module 2 learns the battery capacity as the Hybrid/EV battery pack is discharged and charged. Once learned, the capacity value is allowed to change over a long period of time, as the battery ages.

Replacement of the battery pack, all battery sections or the Hybrid Powertrain Control Module 2 requires capacity learning at a faster rate than normal.

To enable hardware replacement, the Hybrid Powertrain Control Module 2 can be placed into a fast learn mode with the scan tool.

Activating the fast Capacity Learn mode will reset the battery capacity to a much lower value and subsequent charge/discharge cycles will then learn the capacity back up to the proper value. Initially this may have a noticeable effect on EV range until the capacity learning for the new hardware begins. It may take several battery pack depletions and charges for a maximum EV range to be learned/displayed.

Diagnostic Aids

The Hybrid/EV Battery Pack Capacity Learn procedure must be completed when the following components are replaced:

- Hybrid Powertrain Control Module 2
- Hybrid/EV Battery Pack
- All battery sections

Whenever the Hybrid/EV Battery Pack Capacity Learn is activated the vehicle needs to be operated in a normal manner in order to learn an accurate battery capacity value.

NEVER disconnect the 12V battery supply to the vehicle or the Hybrid Powertrain Control Module 2 after initially activating the Hybrid/EV Battery Pack Capacity Learn. Loss of 12V power will force the Hybrid Powertrain Control Module 2 to store the current capacity value as accurate and will also disable fast learning. The process needs to complete without 12V battery interruption for the best results. Repeat the Hybrid/EV Battery Pack Capacity Learn any time 12V battery interruption occurs prior to operating the vehicle by driving and/or charging. It is possible to observe whether an update has occurred by looking at the battery capacity after charging and/or driving the vehicle.

Hybrid/EV Battery Pack Capacity Learn

NOTE: **Hybrid/EV Battery Pack Capacity Learn should ONLY be activated when the battery pack, ALL battery sections or the Hybrid Powertrain Control Module 2 has been replaced.**

The Hybrid/EV Battery Pack Capacity Learn procedure can be activated with a scan tool using the following steps:

1. Vehicle On
2. With a scan tool, select Hybrid Powertrain Control Module 2 Configuration/Reset Functions. Select the Learn Functions -Hybrid/EV Battery Pack Capacity Learn and command a Learn.
3. Observe and record the alphanumeric value in the Hybrid/EV Battery Pack Capacity scan tool parameter.
4. Connect the vehicle charge cord and completely charge the hybrid/EV battery pack.
5. The vehicle is OK to return to the customer. Inform the customer that their EV range will continue to learn as the vehicle is operated normally. Longer drive trips followed by full charging will allow the fastest learn.
6. If the customer returns with an EV Range concern, contact technical assistance.

HYBRID/EV BATTERY CELL BALANCING

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

Hybrid/EV Battery Cell Balancing

The **EL-50332** Hybrid/EV Battery Service Tool is used to match the voltage level of a replacement battery section to the existing battery sections following a service event. The tool will charge or discharge the replacement section, as required, based on measured cell group voltage data. The **EL-50332** requires feedback from the battery energy control module during the balancing process. Communication is through the A4 Hybrid/EV Battery Pack connectors and a low voltage interface harness provided with the **EL-50332** Hybrid/EV Battery Service Tool. The charging and discharging is performed by direct alligator clamp connection to the replacement battery module positive and negative terminals.

Each battery section contains two battery cell modules. With the exception of section/row 5, the two battery cell modules are not electrically connected within their respective section/row and will need to be balanced individually and sequentially. Refer to Drive Motor Battery System Description .

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

WARNING: **High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.**

WARNING: **This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test**

equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: **Damage to a Lithium Ion hybrid/EV battery pack could result in fire, loss of electrical isolation or exposure to high voltage. Until the high voltage system inspection has been completed, store the vehicle with hybrid/EV battery pack installed outside in a secure area away from buildings and other vehicles and protected from rain, snow and other moisture. Remove the hybrid/EV battery pack high voltage manual disconnect lever and store it in a secure place outside the vehicle. Cover the exposed high voltage opening with ULÂ® listed, or equivalent, insulation tape rated at a minimum of 600 V.**

Failure to follow these precautions could result in personal injury, death and property damage.

EL-50332 Configuration Procedure

NOTE: **Depending on the state of charge variation of the replacement section/row and the remaining battery pack sections, the balance process may take up to 40 hours to complete. You may stop or pause the process at any time. Regardless of your progress through the procedure, whenever restarting the EL-50332 you will always be required to connect to the first module, if only for a momentary voltage check.**

NOTE: **Before balancing a battery section, make sure all of the external EL-50332 components and cables are in good condition and working order.**

1. Connect the **EL-50332-145** black cable, **EL-50332-150** red cable, and **EL-50332-155** green cable to the **EL-50332-105** fuse box.
2. Connect the **EL-50332-120** cable to the **EL-50332-105** fuse box.
3. Connect the **EL-50332-120** cable to the **EL - 50332** service tool.
4. Connect the **EL-50332-325** harness to the **EL-50332-270** vehicle interface module 2.
5. Connect the **EL-50332-125** 24-pin cable to the **EL-50332-270** vehicle interface module 2.
6. Connect the **EL-50332-125** 24-pin cable to the **EL-50332** service tool.

Cell Balance Procedure

NOTE: **Refer to the Special Tools for the correct regional power cord.**

1. Connect the appropriate regional power cord to the **EL-50332** service tool.
2. Connect the appropriate regional power cord into a known good power outlet.
3. Turn ON the **EL - 50332** service tool using the power switch.
4. At the MAIN MENU, select SECTION BALANCE, press the SELECT soft key.
5. At the TYPE menu, select Bolt EV, press the NEXT soft key.
6. At the TARGET menu, select service replacement section (row) to be balanced, press the NEXT soft key.

Connection Procedure Module 1 of 2

1. Connect the **EL-50332-155** green cable to the A4 Hybrid/EV Battery Pack ground G350.

NOTE: **Observe the EL - 50332 screen to identify which module of the**

section/row to balance first.

2. Connect the **EL-50332-145** black cable to the module negative stud to be balanced. Refer to Hybrid/EV Energy Storage Schematics for Hybrid Battery Sections 1 - 5.
3. Connect the **EL-50332-150** red cable to the module positive stud to be balanced. Refer to Hybrid/EV Energy Storage Schematics for Hybrid Battery Sections 1 - 5.
4. Press the NEXT soft key.
5. Connect the **EL-50332-325** harness to the A4 Hybrid/EV Battery Pack.

Balancing Procedure Module 1 of 2

1. Press the NEXT soft key.

NOTE: **The EL - 50332 will now balance the selected module by charging/discharging, as appropriate. Target voltage will be based on measured pack cell group voltages. Initial balancing will be in a constant current mode - max 5 amp charge, 7.5 amp discharge. The tool will transition to a constant voltage mode - decreasing current near the end of the event.**

2. An audible tone will sound at the end of balancing or in the event of a fault condition.
   - If a fault condition was detected, refer to the **EL - 50332** Hybrid/EV Battery Service Tool Instruction Manual.
   - If a fault condition was not detected
3. Module balancing completed successfully and the second module will need to be balanced. Observe the **EL - 50332** screen to identify the next module to connect.

Connection Procedure Module 2 of 2

1. Connect the **EL-50332-155** green cable to the A4 Hybrid/EV Battery Pack ground G350.
2. Connect the **EL-50332-145** black cable to the second module negative stud to be balanced. Refer to Hybrid/EV Energy Storage Schematics for Hybrid Battery Sections 6 - 10.
3. Connect the **EL-50332-150** red cable to the second module positive stud to be balanced. Refer to Hybrid/EV Energy Storage Schematics for Hybrid Battery Sections 6 - 10.

Balancing Procedure Module 2 of 2

1. Press the NEXT soft key.

NOTE: **The EL - 50332 will now balance the selected module by charging/discharging, as appropriate. Target voltage will be based on measured pack cell group voltages. Initial balancing will be in a constant current mode - max 5 amp charge, 7.5 amp discharge. The tool will transition to a constant voltage mode - decreasing current near the end of the event. A warranty code and pack voltage current data will be displayed at the conclusion of the balancing event.**

2. An audible tone will sound at the end of balancing or in the event of a fault condition.
   - If a fault condition was detected, refer to the **EL - 50332** Hybrid/EV Battery Service Tool Instruction Manual.
   - If a fault condition was not detected
3. Section balancing completed successfully.

7. At the Completed menu, press the NEXT soft key. Record warranty code. Press the EXIT soft key.
8. All OK.

HYBRID/EV BATTERY SYSTEM VERIFICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

Hybrid/EV Battery System Verification

The **EL-50332** Hybrid/EV Battery Service Tool communicates with the battery energy control module through the A4 Hybrid/EV Battery Pack X357 and X358 connectors. The tool displays battery cell group voltages along with the calculated voltage difference between the highest and lowest readings. The tool also displays the temperatures read by the thermistors located within the battery sections. By reviewing this data, technicians can verify circuit integrity within the A4 Hybrid/EV Battery Pack prior to attaching the Hybrid/EV Battery Cover.

Diagnostic Aids

Hybrid/EV Battery System Verification requires that the battery pack is removed from the vehicle and that the battery energy control module contains software. If you are installing a service replacement battery energy control module, connect the battery pack to the vehicle with the **EL-52014** Low Voltage Jumper Harness Extension and program the battery energy control module prior to performing Hybrid/EV Battery System Verification. Perform the **Clear Secured High Voltage DTCs** procedure after successfully programming the service replacement battery energy control module.

Special Tools

- **EL - 50332** Hybrid/EV Battery Service Tool
- **EL - 50332 - 125** Vehicle Interface Module Low Voltage 24-Pin Cable
- **EL - 50332 - 175** 120 V Power Cable
- **EL-50332-180** 250 V Power Cable - AUS
- **EL-50332-185** 250 V Power Cable - EU/Korea
- **EL - 50332 - 270** Vehicle Interface Module 2

- **EL - 50332 - 325** Low Voltage Communication Harness
- **EL-52014** Low Voltage Jumper Harness Extension

For equivalent regional tools, refer to **Special Tools**

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

WARNING: **High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.**

WARNING: **This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.**

Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: **Damage to a Lithium Ion hybrid/EV battery pack could result in fire, loss of electrical isolation or exposure to high voltage. Until the high voltage system inspection has been completed, store the vehicle with hybrid/EV battery pack installed outside in a secure area away from buildings and other vehicles and protected from rain, snow and other moisture. Remove the hybrid/EV battery pack high voltage manual disconnect lever and store it in a secure place outside the vehicle. Cover the exposed high voltage opening with ULÂ® listed, or equivalent, insulation tape rated at a minimum of 600 V.**

Failure to follow these precautions could result in personal injury, death and property damage.

NOTE: **Before performing the Hybrid/EV Battery System Verification, make sure all of the external EL-50332 components are in good condition and working order.**

1. Connect the **EL-50332-125** 24-pin cable to the **EL-50332-270** vehicle interface module 2.
2. Connect the **EL-50332-125** 24-pin cable to the **EL-50332** service tool.

NOTE: **Refer to the Special Tools for the correct regional power cord.**

3. Connect the appropriate regional power cord to the **EL-50332** service tool.
4. Connect the appropriate regional power cord into a known good power outlet.

5. Power ON the **EL-50332** service tool using the power switch.
6. At the MAIN MENU, select PACK INFO, press the SELECT soft key.

NOTE: **Selecting One-shot will take and display a single snapshot of the battery parameters, selecting Continuous will display live parameter values.**

7. At the PACK INFO TYPE, select ONE-SHOT, press the NEXT soft key.
8. At the MANUFACTURER menu, select correct BRAND, press the NEXT soft key.
9. At the MODEL menu, select correct MODEL, press the NEXT soft key.
10. At the COMM CONNECTION menu, select HYBRID BATTERY CONTACTOR ASSEMBLY, press the NEXT soft key.
11. Connect the **EL-50332-325** low voltage communication harness to the A4 Hybrid/EV Battery Pack.
12. Connect the **EL-50332-325** low voltage communication harness to the **EL-50332-270** vehicle interface module 2, press the NEXT soft key.
13. At the PACK INFO menu, scroll down to the DELTA VCELL parameter. Record and verify the DELTA VCELL is less than 0.1 V.
    - **If the DELTA VCELL is 0.1 V or greater**
    1. At the PACK INFO menu, press the EXIT soft key to end the Hybrid/EV Battery System Verification.
    2. Remove the **EL-50332-325** low voltage communication harness from the A4 Hybrid/EV Battery Pack.
    3. Verify any repairs performed are complete and that all connections are secure.

    NOTE: **Recheck the EL - 50332 cable connections by beginning at step 1 of the Hybrid/EV Battery System Verification.**

    4. Retest the Hybrid/EV Battery System Verification once all repairs have been rechecked.
    - **The DELTA VCELL is less than 0.1 V**
14. Record and verify all of the battery temperature sensor readings are within 6Â°C (10.8Â°F) of each other.
    - **If any of the battery temperature sensor readings are 6Â°C (10.8Â°F) or greater of each other**
    1. At the PACK INFO menu, press the EXIT soft key to end the Hybrid/EV Battery System Verification.
    2. Remove the **EL-50332-325** low voltage communication harness from the A4 Hybrid/EV Battery Pack.
    3. Verify any repairs performed are complete and that all connections are secure.

    NOTE: **Recheck the EL - 50332 cable connections by beginning at step 1 of the Hybrid/EV Battery System Verification.**

    4. Retest the Hybrid/EV Battery System Verification once all repairs have been rechecked.
    - **The battery temperature sensor readings are within 6Â°C (10.8Â°F) of each other**
15. All OK.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0480: COOLING FAN RELAY CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0480

Cooling Fan Relay Control Circuit

Circuit/System Description

The radiator cooling fan is controlled with a pulse width modulated (PWM) signal on the cooling fan control circuit from the hybrid/EV powertrain control module 2. Although the hybrid/EV powertrain control module 2 is directly connected to the cooling fan, the ECM is considered the master controller. The ECM sends a fan command PWM signal to the hybrid/EV powertrain control module 2 through the cooling fan signal hardwire circuit. The hybrid/EV powertrain control module 2 operates in a pass-through mode for any ECM-derived fan request. The higher the duty cycle the higher the cooling fan speed.

Conditions for Running the DTC

The 12 V battery voltage is greater than 10.2 V.

Conditions for Setting the DTC

The Hybrid/EV Powertrain Control Module 2 has detected an open, short to ground or short to voltage fault on the fan control circuit.

Action Taken When the DTC Sets

DTC P0480 is a type B DTC.

Conditions for Clearing the DTC

DTC P0480 is a type B DTC.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that the cooling fan is operating at high speed when commanding the Cooling Fan Motor Command to 90% with a scan tool.
    - **If the cooling fan is not operating at high speed**

      Refer to Circuit/System Testing

    - **If the cooling fan is operating as commanded**
3. Verify the cooling fan is operating at a low speed when commanding the Cooling Fan Motor Command to 10% with a scan tool.
    - **If the cooling fan is not operating at low speed**

      Refer to Circuit/System Testing

    - **If the cooling fan is operating as commanded**
4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate G10 Cooling Fan Motor.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 10 Ω**
3. Connect a test lamp between the B+ circuit terminal 1 and ground.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the G10 Cooling Fan Motor and the fuse.
    - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 4 and the B+ circuit terminal 1.
6. Vehicle in service mode, verify the test lamp changes between dim (10%) and bright (90%) when commanding the Cooling Fan Motor Command ON between 10% and 90% with a scan tool.
    - **If the test lamp is always dim or does not illuminate**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp is always bright**

   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp changes illumination between bright (90%) and dim (10%)**
7. Replace the G10 cooling fan motor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Cooling Fan and Shroud Replacement** for G10 cooling fan motor replacement.
- Refer to **Control Module References** for K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0A7E: HYBRID/EV BATTERY PACK HIGH TEMPERATURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

DTC Descriptors

DTC P0A7E

Hybrid/EV Battery Pack High Temperature

Circuit/System Description

The hybrid/EV battery pack has 6 hybrid/EV battery module temperature sensors. The hybrid/EV powertrain control module 2 uses the battery temperature sensors to determine the hybrid/EV battery module temperature to control the energy storage cooling system operation.

The energy storage system cooling system uses a 12 V hybrid/EV battery pack coolant pump, a refrigerant/coolant heat exchanger (chiller) and the electric A/C compressor motor control module assembly to cool down the high voltage hybrid/EV battery.

Conditions for Running the DTC

- The hybrid/EV powertrain control module 2 and hybrid/EV battery energy control module are awake and communicating.
- The 12 V battery voltage is greater than or equal to 10.2 V.
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, or U179C.

Conditions for Setting the DTC

The maximum sensed temperature in the hybrid/EV battery is greater than 53Â°C (127Â°F).

Action Taken When the DTC Sets

- DTC P0A7E is a type A DTC.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

DTC P0A7E is a type A DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0480, P0534, P0C47, P148A-P148C, P1EC6, P1E8C or P1E8D is not set.
    - **If any DTC is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If none of the DTCs are set**

WARNING: **Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.**

3. Test for proper coolant level and operation of the hybrid/EV battery coolant system, refrigerant system and coolant fan system. Refer to **Hybrid/EV Electronics Cooling Diagnostic (Drive Motor Generator Power Inverter Module Cooling System)Hybrid/EV Electronics Cooling Diagnostic (Drive Motor Battery Cooling System)**, for Drive Motor Battery Cooling System, **Hybrid/EV Battery Pack Coolant Pump Malfunction**, **Cooling Fan Malfunction**, **Hybrid Cooling System Loss of Coolant (Drive Motor Battery Cooling System)Hybrid Cooling System Loss of Coolant (Drive Motor Generator Power Inverter Module Cooling System)**, as appropriate.

Hybrid/EV Battery Temperature Sensor 6 Circuit High Voltage

Circuit/System Description

The hybrid/EV battery pack has 6 hybrid/EV battery temperature sensors. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV battery cell groups. The battery energy control module supplies 5 V to the signal circuit and a ground for the low reference circuit. The hybrid/EV battery temperature sensor resistance changes with battery temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The hybrid/EV powertrain control module 2 uses the battery temperature sensors to determine the hybrid/EV battery module temperature to control the battery cooling system operation.

Conditions for Running the DTC

P0A9C, P0AC6, P0ACB, P0AE9, P0BC3, and P0C34

None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P0C89, P0C8A, P0C8B, P0C8E, P0C8F, P0C90, P0C93, P0C94, P0C95, P0C98, P0C99, P0C9A, P0CA9, P0CAA, P0CAB, P0CAE, P0CAF, P0CB0, P0CB3, P0CB4, P0CB5, P0CB8, P0CB9, P0CBA, P1E8E, P1E8F, P1E90, P1E91, P1E93, P1E94, P1E95, P1E96, P1E97, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, U2401, U2603, U2604, U2605, or U2606.

P0A9D, P0A9E, P0AC7, P0AC8, P0ACC, P0ACD, P0AEA, P0AEB, P0BC4, P0BC5, P0C35, and P0C36

- Hybrid/EV Powertrain Control Module 2 and Battery Energy Control Module are awake and communicating
- None of the following DTCs are set: P1E8E, P1E94, P1E9A, P1EA0, P1FBD, P1FBE, P1FBF, P1FC0, U2603, U2604, U2605, U2606, U2617, U2618, U2619, or U2620.

Conditions for Setting the DTC

P0A9C, P0AC6, P0ACB, P0AE9, P0BC3, and P0C34

The difference between a hybrid/EV battery temperature sensor and the average of the other hybrid/EV battery temperature sensors is greater than a 20Â°C (36Â°F).

P0A9D, P0AC7, P0ACC, P0AEA, P0BC4, and P0C35

The hybrid/EV battery temperature sensor is greater than 87.5Â°C (189.5Â°F).

P0A9E, P0AC8, P0ACD, P0AEB, P0BC5, and P0C36

The hybrid/EV battery temperature sensor is -40Â°C (-40Â°F).

Action Taken When the DTC Sets

- DTCs P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, and P0C36 are Type B DTCs.
- If six sensors fail, the vehicle will operate in a reduced power mode.

Conditions for Clearing the DTC

DTCs P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, and P0C36 are Type B DTCs.

Diagnostic Aids

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

- Low or no coolant in the system may set a DTC P0A9D, P0AC7, P0ACC, P0AEA, P0BC4, or P0C35.
- The B32 Hybrid/EV Battery Temperature Sensors are non-serviceable components of the Hybrid/EV Battery Pack internal wiring harness.

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0C47, P1E8C, or P1EC6 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

   - **If none of the DTCs are set**
3. Observe the scan tool Hybrid Battery 1 - 6 temperature parameters. The sensor readings should be between -39 and +87Â°C (-38.2 and +188.6Â°F) with less than a 15Â°C (27Â°F) difference between any of the temperature sensor readings.
   - **If not within the specified range**

     Refer to Circuit/System Testing.

   - **If within the specified range**
4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**

- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling** . Remove the A4 Hybrid/EV Battery Pack cover. Refer to **Battery Upper Cover Replacement** .

CAUTION: **The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:**

   1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
   2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
   3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

2. Disconnect all K16 battery energy control module connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
3. At the appropriate K16 battery energy control module connector, test for infinite resistance between the signal circuit terminal of the applicable B32 Hybrid/EV Battery Temperature Sensor and chassis ground of the A4 Hybrid/EV Battery Pack.
   - **If less than infinite resistance**

     Replace the Hybrid/EV Battery Pack internal wiring harness.

   - **If infinite resistance**
4. At the appropriate K16 battery energy control module connector, test for 9.9 - 13.4 k Ω at approximately 21.11Â°C (70Â°F) between the signal terminal and the low reference terminal. Refer to **Temperature Versus Resistance** for B32 Hybrid/EV Battery Temperature Sensor.
   - **If not within the specified range**

     Replace the Hybrid/EV Battery Pack internal wiring harness.

   - **If within the specified range**
5. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Control Module Wiring Harness Replacement** for B32 Hybrid/EV Battery Temperature Sensor replacement
- Refer to **Control Module References** for K16 battery energy control module replacement, programming and setup.

DTC P0C43-P0C46: HYBRID/EV BATTERY PACK COOLANT TEMPERATURE SENSOR 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0C43

Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Performance

DTC P0C44

Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Circuit Low Voltage

DTC P0C45

Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Circuit High Voltage

DTC P0C46

Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Circuit Erratic

Circuit/System Description

The hybrid/EV battery pack coolant temperature sensor is located in the coolant outlet of the hybrid/EV battery heater assembly. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV battery coolant. The hybrid/EV battery pack coolant temperature sensor resistance changes with battery coolant temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The battery energy control module uses the hybrid/EV battery temperature sensor to determine the hybrid/EV battery pack temperature to control the battery cooling and heating operations.

Conditions for Running the DTC

P0C43

- Vehicle ON after all high voltage contactor relays had been Open for at least 5 hours.
- The 12 V battery voltage is greater than or equal 10.2 V.
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0C44, P0C45, P0C46, P0C47, P1E8C, P1E8D, P19FD, P19FE, P19FF, or U0111.

P0C44 and P0C45

- The 12 V battery voltage is greater than or equal to 9 V.
- The Battery Energy Control Module is awake and communicating.

P0C46

- The 12 V battery voltage is greater than or equal 10.2 V.
- The Battery Energy Control Module is awake and communicating.
- None of the following DTCs are set: P0C44, P0C45, or U185A.

Conditions for Setting the DTC

P0C43

The hybrid/EV battery pack coolant temperature sensor reading is not within 25Â°C (45Â°F) of the Average Hybrid Battery Pack Temperature AND is not within 20Â°C (36Â°F) of the outside air temperature.

P0C44

The Hybrid/EV Battery Pack Coolant Temperature Sensor 1 is greater than or equal to 87.9Â°C (190.2Â°F).

P0C45

The Hybrid/EV Battery Pack Coolant Temperature Sensor 1 is less than -40Â°C (-40Â°F).

P0C46

The hybrid/EV battery pack coolant temperature sensor is intermittent or has changed by 60Â°C (108Â°F) or greater within 4 s.

Action Taken When the DTC Sets

- DTC P0C43-P0C46 are type B DTCs.
- The active heating mode is disabled.
- The hybrid/EV battery pack coolant pump is commanded to a fixed speed.

Conditions for Clearing the DTC

DTC P0C43-P0C46 are type B DTCs.

Diagnostic Aids

- Low or no coolant in the system may set a DTC P0C43.
- DTC P0C43-P0C46 will prevent battery heating and the vehicle will be unable to start in cold weather with battery temperatures below -25Â°C (-13Â°F).

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor 1 parameter is between -40 and +87.9Â°C (-40 and +190Â°F).
    - **If not within the specified range**

      Refer to Circuit/System Testing.

    - **If within the specified range**
3. Verify the Hybrid/EV Battery Pack Coolant Temperature Sensor 1 and Outside Air Temperature Sensor parameters are within 25Â°C (45Â°F) of each other after the vehicle has been OFF and not charging for 5 hours or greater.

   - **If not within the specified range**

     Refer to Circuit/System Testing.

   - **If within the specified range**

4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

NOTE: **Perform Component Testing of the temperature sensor first and if a sensor fault is found you do not need to perform Circuit/System Testing.**

1. Disconnect the harness X2 connector at the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1.
2. Vehicle in Service Mode. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect A4 Hybrid/EV Battery Pack connector X358.
   2. Test for less than 2 Ω in the low reference circuit from X358 terminal 9 to B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1 harness connector terminal 2.
      - If 2 Ω or greater, repair or replace the battery pack external wiring harness.
      - If less than 2 Ω

        Refer to Internal Hybrid/EV Battery Testing.

   - **If less than 10 Ω**
3. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor 1 is less than -40Â°C (-40Â°F).
   - **If -40Â°C (-40Â°F) or greater**
   1. Vehicle OFF, disconnect A4 Hybrid/EV Battery Pack connector X358.
   2. Test for infinite resistance between the signal circuit terminal 8 X358 and ground.
      - If less than infinite resistance, repair or replace the short to ground on the battery pack external wiring harness.
      - If infinite resistance

        Refer to Internal Hybrid/EV Battery Testing.

   - **If less than -40Â°C (-40Â°F)**
4. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor 1 is greater than 87.9Â°C (190Â°F).
   - **If less than 87.9Â°C (190Â°F)**
   1. Vehicle OFF, disconnect the A4 Hybrid/EV Battery Pack connector X358. Vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair or replace the battery pack external wiring harness.
      - If less than 1 V
   3. Vehicle OFF.

    4. Test for less than 2 Ω in the signal circuit from X358 terminal 8 to B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1 harness connector terminal.
        - If 2 Ω or greater, repair or replace the battery pack external wiring harness.
        - If less than 2 Ω

          Refer to Internal Hybrid/EV Battery Testing

- **If 87.9Â°C (190Â°F) or greater**

5. Test or replace the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1.

Internal Hybrid/EV Battery Testing

1. Disable the high voltage. Refer to **High Voltage Disabling** . Remove the A4 Hybrid/EV Battery Pack cover. Refer to **Battery Upper Cover Replacement** .
2. Disconnect the harness X2 connector at the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1.

NOTE: **With the S15 manual service disconnect removed, the 12 V battery connected, and the Vehicle in Service Mode, additional DTCs may set. Continue with diagnostics and clear any additional DTCs when repairs are complete.**

3. Connect the **EL-50214** Low Voltage Jumper Harness Extension. Connect the 12 V battery.
4. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater

          Replace the Hybrid/EV Battery Pack internal wiring harness or repair the external wiring harness as necessary.

        - If less than 2 Ω
    2. Replace the K16 Battery Energy Control Module.
    - **If less than 10 Ω**
5. Vehicle in Service Mode.
6. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor 1 is less than -40Â°C (-40Â°F).
    - **If -40Â°C (-40Â°F) or greater**
    1. Vehicle OFF, test for infinite resistance between the signal circuit terminal 7 and ground.
        - If less than infinite resistance

          Replace the Hybrid/EV Battery Pack internal wiring harness or repair the short to ground on the external wiring harness as necessary.

        - If infinite resistance
    2. Replace the K16 Battery Energy Control Module.
    - **If less than -40Â°C (-40Â°F)**
7. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor 1 is greater than 87.9Â°C (190Â°F).
    - **If less than 87.9Â°C (190Â°F)**
    1. Vehicle OFF, disconnect the harness connector at the K16 Battery Energy Control Module. Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, replace the Hybrid/EV Battery Pack internal wiring harness or repair the external wiring harness as necessary.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, replace the Hybrid/EV Battery Pack internal wiring harness or repair the external wiring harness as necessary.

        - If less than 2 Ω

          Replace the K16 Battery Energy Control Module.

    - **If 87.9Â°C (190Â°F) or greater**

8. Test or replace the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1.
2. Test for 2.2 - 3.0k Ω at approximately 21.11Â°C (70Â°F) between the signal terminal and the low reference terminal. Refer to **Temperature Versus Resistance** for Hybrid/EV Battery Pack Coolant Temperature Sensor.
    - **If not within the specified range**

      Replace the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1.

    - **If within the specified range**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **High Voltage Battery Heater Replacement** for B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1 replacement
- Refer to **Drive Motor Battery Replacement and Shipping Preparation (Old Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built before 1G1FX6S06H4163254)** **Drive Motor Battery Replacement and Shipping Preparation (New Design Battery Pack in Vehicles built after 1G1FX6S06H4163254)**
- Refer to **Control Module References** for battery energy control module replacement, programming and setup.

DTC P0C47, P1E8C, OR P1E8D: HYBRID/EV BATTERY PACK COOLANT PUMP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0C47

Hybrid/EV Battery Pack Coolant Pump Control Circuit

DTC P1E8C

Hybrid/EV Battery Pack Coolant Pump Enable Circuit Low Voltage

DTC P1E8D

Hybrid/EV Battery Pack Coolant Pump Enable Circuit High Voltage

Circuit/System Description

The hybrid/EV battery pack coolant pump circulates coolant through the hybrid/EV battery refrigerant/coolant heat exchanger, external high voltage battery heater assembly, and the hybrid/EV battery pack to control the temperature of the hybrid/EV battery pack.

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV battery pack coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV battery pack coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV battery pack coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P0C47

The 12 V battery voltage is greater than or equal to 10.2 V.

P1E8C

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The hybrid/EV battery pack coolant pump enable is commanded ON.

P1E8D

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The hybrid/EV battery pack coolant pump enable is OFF.

Conditions for Setting the DTC

P0C47

The hybrid/EV powertrain control module 2 detects the hybrid/EV battery pack coolant pump Control circuit is open, shorted to voltage or shorted to ground.

P1E8C

The hybrid/EV powertrain control module 2 detects the hybrid/EV battery pack coolant pump Enable circuit is shorted to ground.

P1E8D

The hybrid/EV powertrain control module 2 detects the hybrid/EV battery pack coolant pump Enable circuit is open or shorted to voltage.

Action Taken When the DTC Sets

- DTCs P0C47, P1E8C, and P1E8D are type B DTCs.
- DTC P1E8D Hybrid/EV battery pack active heating is disabled.

Conditions for Clearing the DTC

DTCs P0C47, P1E8C, and P1E8D are type B DTCs.

Diagnostic Aids

- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37Â°C (-34Â°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55 percent. Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is in Service Mode*

Displayed PWM Value	Pump Self-Diagnostic Indication
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45 - 55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Control Module References for scan tool information

Circuit/System Verification

1. Verify that DTC P0C43, P0C44, P0C45, P0C46, P1FFB, P1FFC, P1FFD, P1FFE, U0111, U185B, or U2602 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If none of the DTCs are set**
2. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV battery pack coolant pump between 20% and 80% with a scan tool.
    - Hybrid/EV Battery Pack Coolant Pump Command to be 10% or greater.
    - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
    - Hybrid/EV Battery Pack Coolant Pump Speed is greater than 500 RPM.
    - **The scan tool parameters listed are not the specified values**

      Refer to Circuit/System Testing.

    - **The scan tool parameters listed are within the specified values**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G37 Hybrid/EV Battery Pack Coolant Pump.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
    - **If 5 Ω or greater**

      Repair the open/high resistance on the ground circuit.

    - **If less than 5 Ω**
3. Vehicle ON.
4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.
    - **If less than B+**
    1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω and the fuse is blown, replace the G37 Hybrid/EV Battery Pack Coolant Pump.
    - **If B+**
5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.
6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.
    - **If the test lamp is ON**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 1 V between the pump enable circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp is OFF**
7. Vehicle ON, verify the test lamp illuminates. Command the Hybrid Battery Pack Coolant Pump ON (20 - 80%) with a scan tool if necessary.
    - **If the test lamp is OFF**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the enable circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the enable circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp is ON**
8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
9. Verify that a test lamp changes illumination between bright (20%) and dim (80%) when commanding the Hybrid Battery Pack Coolant Pump ON between 20% and 80% with a scan tool.
    - **If the test lamp is always dim or does not illuminate**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle ON.
    2. Test for less than 1 V between the control circuit terminal and ground
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.

    - **If the test lamp is always bright**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **The test lamp changes illumination between bright (20%) and dim (80%)**

10. Remove the test lamp.
11. Verify the scan tool, Hybrid Battery Pack Coolant Pump Feedback parameter is 0%.
    - **If greater than 0%**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 0%**
12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
13. Verify the scan tool Hybrid Battery Pack Coolant Pump Feedback parameter is greater than 90%.
    - **If 90% or less**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 1 V between the feedback circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the feedback circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If greater than 90%**
14. Replace the G37 Hybrid/EV Battery Pack Coolant Pump.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump)** (RESS Pump) for G37 Hybrid/EV Battery Pack Coolant Pump replacement.
- Refer to **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0CE9, P1F44, OR P1F45: HYBRID/EV ELECTRONICS COOLANT PUMP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0CE9

Hybrid/EV Electronics Coolant Pump Control Circuit

DTC P1F44

Hybrid/EV Electronics Coolant Pump Enable Circuit Low Voltage

DTC P1F45

Hybrid/EV Electronics Coolant Pump Enable Circuit High Voltage

Circuit/System Description

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump. When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV electronics coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV electronics coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV electronics coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P0CE9

The 12 V battery voltage is greater than 10.2 V.

P1F44

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV electronics coolant pump is enabled.

P1F45

- The 12 V battery voltage is greater than 10.2 V.
- The Hybrid/EV Electronics Coolant Pump is disabled.

Conditions for Setting the DTC

P0CE9

The Hybrid/EV Powertrain Control Module 2 has detected an open, short to voltage or short to ground on the Hybrid/EV electronics coolant pump control circuit.

P1F44

The Hybrid/EV Powertrain Control Module 2 has detected an open, or short to voltage on the Hybrid/EV electronics coolant pump enable circuit.

P1F45

The Hybrid/EV Powertrain Control Module 2 has detected an open or short to voltage on the Hybrid/EV electronics coolant pump enable circuit.

Action Taken When the DTC Sets

DTCs P0CE9, P1F44, and P1F45 are type B DTCs.

P0CE9

Hybrid/EV electronics coolant pump is commanded Off or to Maximum speed.

P1F44 and P1F45

Hybrid/EV electronics coolant pump is commanded Off.

Conditions for Clearing the DTC

DTCs P0CE9, P1F44, and P1F45 are type B DTCs.

Diagnostic Aids

- DTC P1F44 and P1F45 may cause DTC P0CE9 to set.
- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37Â°C (-34Â°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55 percent. Different PWM values will identify when a pump self-diagnostic has failed:

Hybrid/EV Electronics Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is in Service Mode*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45 - 55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Circuit/System Verification

1. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV electronics coolant pump between 20% and 80% with a scan tool.
    - Hybrid/EV Battery Pack Coolant Pump Command to be 10% or greater.
    - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.

- Hybrid/EV Battery Pack Coolant Pump Speed is greater than 500 RPM.
- **The scan tool parameters listed are not within the specified ranges**

  Refer to Circuit/System Testing.

- **The scan tool parameters listed are within the specified range**

2. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G35 Hybrid/EV Electronics Coolant Pump.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
   - **If 5 Ω or greater**

     Repair the open/high resistance on the ground circuit.

   - **If less than 5 Ω**
3. Vehicle ON.
4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.
   - **If less than B+**
   1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω and the fuse is blown, replace the G35 Hybrid/EV Electronics Coolant Pump.
   - **If B+**
5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.
6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.
   - **If the test lamp is ON**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle ON.
   2. Test for less than 1 V between the pump enable circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is OFF**
7. Vehicle ON. Verify the test lamp illuminates. Command the Hybrid/EV electronics coolant pump ON (20 - 80%) if necessary.
   - **If the test lamp is OFF**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the pump enable circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the pump enable circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is ON**
8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
9. Verify the test lamp changes illumination between bright (20%) and dim (80%) when commanding the hybrid/EV electronics coolant pump ON between 20% and 80% with a scan tool.
   - **If the test lamp is always dim or does not illuminate**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle ON.

2. Test for less than 1 V between the control circuit terminal and ground
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V
3. Vehicle OFF.
4. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is always bright**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **The test lamp changes illumination between bright (20%) and dim (80%)**

10. Remove the test lamp.
11. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is 0%.

- **If greater than 0%**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If 0%**

12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
13. Verify the scan tool, Hybrid/EV Electronics Coolant Pump Feedback parameter is greater than 90%.

- **If 90% or less**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle ON.
2. Test for less than 1 V between the feedback circuit terminal and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V
3. Vehicle OFF.
4. Test for less than 2 Ω in the feedback circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If greater than 90%**

14. Replace the G35 Hybrid/EV Electronics Coolant Pump.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump) (PE Pump) for G35 Hybrid/EV Electronics Coolant Pump replacement.
- Refer to Control Module References for K114B Hybrid/EV Powertrain Control Module 2 replacement, programming and setup.

DTC P0CEF-P0CF2: HYBRID/EV ELECTRONICS COOLANT TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0CEF

Hybrid/EV Electronics Coolant Temperature Sensor Performance

DTC P0CF0

Hybrid/EV Electronics Coolant Temperature Sensor Circuit Low Voltage

DTC P0CF1

Hybrid/EV Electronics Coolant Temperature Sensor Circuit High Voltage

DTC P0CF2

Hybrid/EV Electronics Coolant Temperature Sensor Circuit Erratic

Circuit/System Description

The hybrid/EV electronics coolant temperature sensor is located in the coolant radiator. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV electronics coolant. The hybrid/EV electronics coolant temperature sensor resistance changes with coolant temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The Hybrid/EV Powertrain Control Module 2 uses the hybrid/EV electronics coolant temperature sensor to determine the hybrid/EV electronics temperature to control the hybrid/EV electronics cooling operation.

Conditions for Running the DTC

P0CEF

- The 12 V battery voltage is greater than or equal to 10.2 V.
- Vehicle ON for less than 20 s.
- Propulsion system inactive time is greater than 2 hours.
- The hybrid/EV electronics coolant pump off soak time is greater than 2 hours.
- Air conditioning compressor off soak time is greater than 1 hour.
- The On Board Charger module off soak time is greater than 4 hours.
- None of the following DTCs are set; P0071-P0074, P0532, P0533, P0606, P0711-P0713, P0CE9, P0CF0, P0CF1, P0CF2, P1F44, or P1F45.

P0CF0, P0CF1 and P0CF2

- Vehicle ON.
- The 12 V battery voltage is greater than or equal to 10.2 V.

Conditions for Setting the DTC

P0CEF

- The hybrid/EV electronics coolant temperature does not fall within 23Â°C (41Â°F) of the outside air temperature.

  AND

- The hybrid/EV electronics coolant temperature does not fall within 23Â°C (41Â°F) of the transmission fluid temperature.

  AND

- The hybrid/EV electronics coolant temperature does not fall within 24Â°C (43Â°F) of the air conditioning high side pressure, converted to temperature.

P0CF0

The hybrid/EV electronics coolant temperature signal circuit voltage is less than 0.25 V.

P0CF1

The hybrid/EV electronics temperature signal circuit voltage is greater than 4.9 V.

P0CF2

- The hybrid/EV electronics coolant temperature is intermittent or has changed greater than 75Â°C (135Â°F).
- Condition exists for 4 seconds or more.

Action Taken When the DTC Sets

- DTC P0CEF-P0CF2 are type B DTCs.
- The Hybrid/EV Electronics Coolant Pump is commanded to a fixed speed.
- The radiator cooling fan is commanded to a fixed speed.

Conditions for Clearing the DTC

DTC P0CEF-P0CF2 are type B DTCs.

Circuit/System Verification

1. Verify that DTC P0CE9 is not set.
    - **If the DTC is set**

      Refer to **DTC P0CE9, P1F44, or P1F45**

    - **If the DTC is not set**
2. Observe the scan tool Hybrid/EV Powertrain Control Module 2 Hybrid Electronics Coolant Temperature parameter. The readings should be between -40Â° and +87.9Â°C (-40Â° and +190Â°F).
    - **The readings are not within the specified range**

      Refer to Circuit/System Testing

   - **The readings are within the specified range**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B202 Hybrid/EV Electronics Coolant Temperature Sensor.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Disconnect the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Hybrid Electronics Coolant Temperature is less than -40Â°C (-40Â°F).
   - **If -40Â°C (-40Â°F) or greater**
   1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than -40Â°C (-40Â°F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the scan tool Hybrid Electronics Coolant Temperature parameter is greater than 87.9Â°C (190Â°F).
   - **If less than 87.9Â°C (190Â°F)**
   1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If 87.9Â°C (190Â°F) or greater**
6. Test or replace the B202 Hybrid/EV Electronics Coolant Temperature Sensor.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B202 Hybrid/EV Electronics Coolant Temperature Sensor.
2. Test for 2.2 - 3.0k Ω at approximately 21.11Â°C (70Â°F) between the signal terminal and the low reference terminal.
   - **If not within the specified range**

     Replace the B202 Hybrid/EV Electronics Coolant Temperature Sensor.

   - **If within the specified range**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Engine Coolant Temperature Sensor Replacement - Radiator Side**
- Refer to **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P1485-P1487: COOLING FAN OUTPUT CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1485

Cooling Fan Output Circuit

DTC P1486

Cooling Fan Output Circuit Low Voltage

DTC P1487

Cooling Fan Output Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cooling Fan Speed Signal Circuit	P148B, P1486	P148A, P1485	P148C, P1487	-
Fans operate at 90% with all malfunctions				

Circuit/System Description

The hybrid/EV powertrain control module 2 indirectly controls the radiator fans. When propulsion is active, the engine control module (ECM) processes all requests for the cooling fans to be turned ON regardless of which module originates the request. The ECM decides if and at what speed the cooling fans should operate. The ECM sends the cooling fan command to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 sends the signal to the cooling fans to operate and at what speed. If the vehicle is in Charge Mode and the hybrid/EV powertrain control module 2 requests the cooling fans to operate and the ECM is not awake, the hybrid/EV powertrain control module 2 will control the cooling fans without ECM intervention.

The ECM communicates the fan command PWM signal to the hybrid/EV powertrain control module 2 through the cooling fan speed signal circuit/hardwire circuit and also sends a redundant serial data signal. Since the hardwire circuit is an output from the ECM but an input to the hybrid/EV powertrain control module 2, each module has unique DTCs to monitor the same circuit.

Conditions for Running the DTC

- DTC P2537 is not set.
- The 12 V battery voltage is equal to or greater than 11 V.
- The accessory circuit is active for greater than 5 s.
- The DTCs run continuously when the conditions above are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the output circuit do not match for greater than 5 s.

Action Taken When the DTC Sets

DTCs P1485, P1486 and P1487 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1485, P1486 and P1487 are Type B DTCs.

Diagnostic Aids

DTCs P1485, P1486 and P1487 will not keep the cooling fan from operating. If one of these DTCs is set the hybrid/EV powertrain control module 2 will command the cooling fan to 90%. If the cooling fan does not operate, refer to **DTC P148A-P148C** for further diagnosis.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P1485, P1486, P1487, P148A, P148B, or P148C is not set.
   - **If the DTC is set**

     Refer to Circuit/System Testing.

   - **If the DTC is not set**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2, vehicle in Service Mode.

   NOTE: **The cooling fan circuit is pulled up to a voltage within the ECM. 3 - 4 V measured on this circuit with the hybrid/EV powertrain control module 2 disconnected is normal.**

2. Test for 3 - 4 V between the cooling fan circuit terminal 9 and ground.
   - **If less than 3 V**
   1. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the cooling fan circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If 4V or greater**
    1. Vehicle OFF. Disconnect the X1 harness connector at the K20 Engine Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the cooling fan circuit and ground.
        - If greater than 1 V, repair the short to voltage on the circuit.
        - If 1 V or less, replace the K20 Engine Control Module.
    - **If 3 - 4 V**
3. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
4. Reconnect the K114B Hybrid/EV Powertrain Control Module 2 connector X2.
5. Vehicle in Service Mode. Test for greater than 10 V between the signal circuit and ground.
    - **If 10 V or less**

      Replace the Hybrid/EV Powertrain Control Module 2.

    - **If greater than 10 V**
6. Replace the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K20 engine control module or K114B hybrid powertrain control module 2 replacement, programming and setup

DTC P19FA-P19FC: HYBRID/EV ELECTRONICS COOLANT PUMP FEEDBACK CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P19FA

Hybrid/EV Electronics Coolant Pump Feedback Circuit High Frequency

DTC P19FB

Hybrid/EV Electronics Coolant Pump Feedback Circuit Low Frequency

DTC P19FC

Hybrid/EV Electronics Coolant Pump Feedback Circuit Performance

Circuit/System Description

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV electronics coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV electronics coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV electronics coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P19FA and P19FB

- The 12 V battery voltage is greater than 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 11 - 100%.
- The coolant pump On time is greater than 3 s.

P19FC

- The 12 V battery voltage is greater than 10.2 V.
- The coolant pump is disabled for at least 10 s.
- DTC P19FC has not already failed when coolant pump was enabled.
- None of the following DTCs are set: P0CE9, P0CEF, P0CF0, P0CF1, P0CF2, P1F44, or P1F45.

  OR

- The 12 V battery voltage is greater than 10.2 V.
- The coolant pump is enabled.
- The coolant pump PWM command is 10.5 - 90%.
- The coolant pump On delay time is greater than 10 s.
- Hybrid/EV electronics coolant temperature sensor is greater than -30Â°C (-22Â°F).
- All above conditions met for at least 5 seconds.
- None of the following DTCs are set: P0CE9, P0CEF, P0CF0, P0CF1, P0CF2, P1F44, or P1F45.

Conditions for Setting the DTC

P19FA

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit frequency is greater than 750 Hz.

P19FB

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit frequency is less than 8.6 Hz.

P19FC

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit indicated pump speed is greater than 215 RPM when the pump is not enabled.

OR

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit indicated pump speed is more than 800 RPM different than the expected pump speed when the pump is commanded between 11 - 90% PWM.

Action Taken When the DTC Sets

DTCs P19FA, P19FB and P19FC are type B DTCs.

Conditions for Clearing the DTC

DTCs P19FA, P19FB and P19FC are type B DTCs.

Diagnostic Aids

- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37Â°C (-34Â°F).

- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55%. Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is in Service Mode*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45-55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Circuit/System Verification

1. Verify that DTC P0C43, P0C44, P0C45, P0C46, or P0C47 is not set.
   - **If any DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
   - **If none of the DTCs are set**
2. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV electronics coolant pump between 20% and 80% with a scan tool.
   - Hybrid/EV Electronics Coolant Pump Command to be 10% or greater.
   - Hybrid/EV Electronics Coolant Pump Feedback to be 50% +/-5%.
   - Hybrid/EV Electronics Coolant Pump Speed is greater than 500 RPM.
   - **The scan tool parameters listed are not within the specified ranges**

   Refer to Circuit/System Testing.

   - **The scan tool parameters listed are within the specified ranges**

3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G35 Hybrid/EV Electronics Coolant Pump.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
   - **If 5 Ω or greater**

     Repair the open/high resistance on the ground circuit.

   - **If less than 5 Ω**
3. Vehicle ON.
4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.
   - **If less than B+**
   1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω and the fuse is blown, replace the G35 Hybrid/EV Electronics Coolant Pump.
   - **If B+**
5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.
6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.
   - **If the test lamp is ON**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 1 V between the pump enable circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B hybrid/EV powertrain control module 2.
   - **If the test lamp is OFF**
7. Vehicle ON. Verify the test lamp illuminates. Command the Hybrid/EV Electronics Coolant Pump ON (20 - 80%) with a scan tool if necessary.
   - **If the test lamp is OFF**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the pump enable circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the pump enable circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is ON**
8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
9. Verify that a test lamp changes illumination between bright (20%) and dim (80%) when commanding the Hybrid/EV Electronics Coolant Pump ON between 20% and 80% with a scan tool.
   - **If the test lamp is always dim or does not illuminate**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.

        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp is always bright**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **The test lamp changes illumination between bright (20%) and dim (80%)**
10. Remove the test lamp.
11. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is 0%.
    - **If greater than 0%**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 0%**
12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
13. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is greater than 90%.
    - **If 90% or less**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 1 V between the feedback circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If greater than 90%**
14. Replace the G35 Hybrid/EV Electronics Coolant Pump.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump)** (PE Pump) for G35 Hybrid/EV electronics coolant pump replacement.
- Refer to **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P19FD-P19FF: HYBRID/EV BATTERY PACK COOLANT PUMP FEEDBACK CIRCUIT

DTC P19FF

Hybrid/EV Battery Pack Coolant Pump Feedback Circuit Performance

Circuit/System Description

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV battery pack coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV battery pack coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV battery pack coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P19FD and P19FE

- The 12 V battery voltage is greater than 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 11 - 100%.
- All above conditions met for at least 3 s.

P19FF

- The 12 V battery voltage is greater than 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 10.5 - 90%.
- The coolant pump is disabled for at least 11 s.

OR

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 10.5 - 90%.
- Hybrid/EV battery pack coolant inlet temperature sensor is greater than -20Â°C (-4Â°F).
- All above conditions met for at least 5 seconds.
- None of the following DTCs are set: P0C43, P0C44, P0C45, P0C47, P1E8C, P1E8D, P19FD or P19FE.

Conditions for Setting the DTC

P19FD

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit frequency is greater than 750 Hz.

P19FE

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit frequency is less than 8.6 Hz.

P19FF

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit indicated pump speed is greater than 215 RPM when the pump is not enabled.

OR

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit indicated pump speed is more than 800 RPM different than the expected pump speed when the pump is commanded between 11 - 90% PWM.

Action Taken When the DTC Sets

DTCs P19FD, P19FE and P19FF are type B DTCs.

Conditions for Clearing the DTC

DTCs P19FD, P19FE and P19FF are type B DTCs.

Diagnostic Aids

- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37Â°C (-34Â°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55%. Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is in Service Mode*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45-55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Circuit/System Verification

1. Verify that DTC P0C43, P0C44, P0C45, P0C46, P1FFB, P1FFC, P1FFD, P1FFE, U0111, U185B, or U2602 is not set.
   - **If any DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
2. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV battery pack coolant pump between 20% and 80% with a scan tool.
   - Hybrid/EV Battery Pack Coolant Pump Command to be 10% or greater.
   - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
   - Hybrid/EV Battery Pack Coolant Pump Speed is greater than 500 RPM.
   - **The scan tool parameters listed are not within the specified ranges**

     Refer to Circuit/System Testing.

   - **The scan tool parameters listed are within the specified ranges**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G37 Hybrid/EV Battery Pack Coolant Pump.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
   - **If 5 Ω or greater**

     Repair the open/high resistance on the ground circuit.

   - **If less than 5 Ω**
3. Vehicle ON.
4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.
   - **If less than B+**
   1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω and the fuse is blown, replace the G37 Hybrid/EV Battery Pack Coolant Pump.
   - **If B+**
5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.
6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.
   - **If the test lamp is ON**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 1 V between the pump enable circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B hybrid/EV powertrain control module 2.
   - **If the test lamp is OFF**
7. Vehicle ON. Verify the test lamp illuminates. Command the Hybrid Battery Pack Coolant Pump ON (20 - 80%) with a scan tool if necessary.
   - **If the test lamp is OFF**

   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the pump enable circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the pump enable circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is ON**
8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
9. Verify that a test lamp changes illumination between bright (20%) and dim (80%) when commanding the Hybrid Battery Pack Coolant Pump ON between 20% and 80% with a scan tool.
   - **If the test lamp is always dim or does not illuminate**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is always bright**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **The test lamp changes illumination between bright (20%) and dim (80%)**
10. Remove the test lamp.
11. Verify the scan tool Hybrid Battery Pack Coolant Pump Feedback parameter is 0%.
    - **If greater than 0%**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 0%**
12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
13. Verify the scan tool Hybrid Battery Pack Coolant Pump Feedback parameter is greater than 90%.
    - **If 90% or less**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 1 V between the feedback circuit terminal and ground.
       - If 1 V or greater, repair the short to voltage on the circuit.
       - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If greater than 90%**
14. Replace the G37 Hybrid/EV Battery Pack Coolant Pump.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump)** (RESS Pump) for G37 Hybrid/EV battery pack coolant pump replacement.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cooling Fan Speed Signal Circuit	P148B, P1486	P148A, P1485	P148C, P1487	-
Fans operate at 90% with all malfunctions				

Circuit/System Description

The hybrid/EV powertrain control module 2 indirectly controls the radiator fans. When propulsion is active, the engine control module (ECM) processes all requests for the cooling fans to be turned ON regardless of which module originates the request. The ECM decides if and at what speed the cooling fans should operate. The ECM sends the cooling fan command to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 sends the signal to the cooling fans to operate and at what speed. If the vehicle is in Charge Mode and the hybrid/EV powertrain control module 2 requests the cooling fans to operate and the ECM is not awake, the hybrid/EV powertrain control module 2 will control the cooling fans without ECM intervention.

The ECM communicates the fan command PWM signal to the hybrid/EV powertrain control module 2 through the cooling fan speed signal circuit/hardwire circuit and also sends a redundant serial data signal. Since the hardwire circuit is an output from the ECM but an input to the hybrid/EV powertrain control module 2, each module has unique DTCs to monitor the same circuit.

Conditions for Running the DTC

P148A

- The 12 V battery voltage is greater than 10.2 V.
- The propulsion system is active for more than 44 s.
- The cooling fan speed has not changed by greater than 5%.
- None of the following DTCs are set: P148B, P148C, or U0293.

  OR

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The propulsion system is inactive.
- The energy storage system thermal condition request is ActiveCool.
- The cooling fan is enabled for more than 49 s.
- The cooling fan speed has not changed by greater than 5%.
- None of the following DTCs are set: P148B, P148C, or U0293.

P148B

The 12 V battery voltage is greater than 10.2 V.

P148C

- The 12 V battery voltage is greater than 10.2 V.
- The propulsion system is active for more than 49 s.

  OR

- The 12 V battery voltage is greater 10.2 V.
- The propulsion system is inactive.
- The energy storage system thermal condition request is ActiveCool.
- The cooling fan is enabled for more than 49 s.

Conditions for Setting the DTC

P148A

The PWM cooling fan signal duty cycle request from Engine Control Module (Hardwire) is not within 25% of the redundant engine cooling fan speed sent to the hybrid/EV powertrain control module 2 via serial data.

P148B

The Hybrid/EV Powertrain Control Module 2 has detected a cooling fan signal circuit duty cycle of less than 3% from the engine control module.

P148C

The Hybrid/EV Powertrain Control Module 2 has detected a cooling fan signal circuit duty cycle of greater than 97% from the engine control module.

Action Taken When the DTC Sets

DTCs P148A, P148B and P148C are type B DTCs.

Conditions for Clearing the DTC

DTCs P148A, P148B and P148C are type B DTCs.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P1485, P1486, P1487, P148A, P148B, or P148C is not set.
    - **If the DTC is set**

      Refer to Circuit/System Testing.

    - **If the DTC is not set**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2, vehicle in Service Mode.

   NOTE: **The cooling fan circuit is pulled up to a voltage within the ECM. 3 - 4 V measured on this circuit with the hybrid/EV powertrain control module 2 disconnected is normal.**

2. Test for 3 - 4 V between the cooling fan circuit terminal 9 and ground.
    - **If less than 3 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the cooling fan circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If 4V or greater**
    1. Vehicle OFF. Disconnect the X1 harness connector at the K20 Engine Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the cooling fan circuit and ground.
        - If greater than 1 V, repair the short to voltage on the circuit.
        - If 1 V or less, replace the K20 Engine Control Module.
    - **If 3 - 4 V**
3. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
4. Reconnect the K114B Hybrid/EV Powertrain Control Module 2 connector X2.
5. Vehicle in Service Mode. Test for greater than 10 V between the signal circuit and ground.
    - **If 10 V or less**

      Replace the Hybrid/EV Powertrain Control Module 2.

    - **If greater than 10 V**
6. Replace the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for engine control module, hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P1EC6: HYBRID/EV BATTERY PACK HEATER PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1EC6

Hybrid/EV Battery Pack Heater Performance

Circuit/System Description

The Hybrid/EV Battery Pack Coolant Heater is mounted to the coolant inlet external of the battery pack. The Hybrid/EV Battery Pack Coolant Heater uses high voltage as the power source. The T24 Battery Charger controls the Hybrid/EV Battery Pack Coolant Heater and contains a non-serviceable fuse to protect the high voltage circuits.

When the Conditions for Running the DTC are met, the Hybrid/EV Battery Pack Coolant Heater is commanded ON. The Hybrid/EV Powertrain Control Module 2 then monitors for a temperature change at the Hybrid/EV Battery Pack coolant temperature sensor 1 to determine if the Hybrid/EV Battery Pack Coolant Heater is functioning properly.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV battery pack coolant temperature sensor is less than 21Â°C (70Â°F).
- Runs once per drive cycle, either in propulsion system active or in Charge Mode.
- Hybrid/EV battery pack Active Heating is requested.
- Hybrid/EV battery pack voltage is greater than 221 V.
- None of the following DTCs are set; P0C43, P0C44, P0C45, P0C47, P19FD, P19FE, P19FF, P1EC3, P1E8C, P1E8D, P1FFB, P1FFC, P1FFD, or P1FFE.

Conditions for Setting the DTC

- The hybrid/EV powertrain control module 2 commands the hybrid/EV battery pack coolant pump OFF and the battery heater ON to 100% for 5.5 seconds, then varies battery heater output in relation to battery voltage for a maximum of 2.5 minutes.
- The hybrid/EV powertrain control module 2 did not see the battery pack coolant temperature rise more than 2.75Â°C (4.9Â°F) within 85 seconds of commanding the battery heater OFF.

Action Taken When the DTC Sets

- DTC P1EC6 is a type B DTC.
- Hybrid/EV battery pack active heating is disabled.

Conditions for Clearing the DTC

DTC P1EC6 is a type B DTC.

Diagnostic Aids

P1EC6 will prevent battery heating and the vehicle will be unable to start in cold weather with battery temperatures below -25Â°C (-13Â°F).

Special Tools

- **EL-48900** HEV Safety Kit
- **EL-50772** Insulation Multimeter

For equivalent regional tools, refer to Special Tools.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE1, P0AE3, P0D0A, P0D09, P1EBD, P1EC0, or P1EC3 is not set.
   - **If any DTC is set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .
   - **If none of the DTCs are set**

   NOTE: **Other DTCs will set.**

3. Vehicle OFF. Remove the G37 Hybrid/EV Battery Pack Coolant Pump fuse. Set the vehicle Charge Mode to IMMEDIATE. Connect the charge cord set. With the vehicle in Charge Mode, Vehicle in Service Mode.
4. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor parameter increases 2.75Â°C (4.9Â°F) within 120 s when commanding the hybrid/EV battery pack coolant heater ON with a scan tool.
   - **If the Hybrid/EV Battery Pack Coolant Temperature Sensor did not increase 2.75Â°C (4.9Â°F) within 120 s**

     Refer to Circuit/System Testing.
   - **If the Hybrid/EV Battery Pack Coolant Temperature Sensor did increase 2.75Â°C (4.9Â°F) within 120 s**
5. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage. Refer to High Voltage Disabling . Disconnect the high voltage harness connector at the E54 Hybrid/EV Battery Pack Coolant Heater.
2. Test for 61 - 75 Ω between terminal A and terminal B at the E54 Hybrid/EV Battery Pack Coolant Heater.
   - **If not within the specified range**

     Replace the T24 Battery Charger and the E54 Hybrid/EV Battery Pack Coolant Heater.

   - **If within the specified range**

NOTE: **The following continuity tests must be performed using an EL-50772 Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.**

3. With the **EL-50772** set on the Isolation test setting, test for 26 - 550M Ω between the E54 Hybrid/EV Battery Pack Coolant Heater terminals listed below and the coolant heater assembly ground:
   - Terminal A
   - Terminal B
   - **If less than the specified value**

     Replace the E54 Hybrid/EV Battery Pack Coolant Heater.

   - **If within the specified value**
4. Replace the T24 Battery Charger.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to High Voltage Battery Control Wiring Junction Block Replacement (With quick charge) High Voltage Battery Control Wiring Junction Block Replacement (Without quick charge) for T24 battery charger replacement.
- Refer to High Voltage Battery Heater Replacement for E54 Hybrid/EV battery pack coolant heater replacement.

DTC P1FFB-P1FFE: HYBRID/EV BATTERY PACK COOLANT LEVEL SENSOR CIRCUIT OR HYBRID/EV BATTERY PACK COOLANT LEVEL LOW

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1FFB

Hybrid/EV Battery Pack Coolant Level Sensor Circuit

DTC P1FFC

Hybrid/EV Battery Pack Coolant Level Sensor Circuit Low Voltage

DTC P1FFD

Hybrid/EV Battery Pack Coolant Level Sensor Circuit High Voltage

DTC P1FFE

Hybrid/EV Battery Pack Coolant Level Low

Circuit/System Description

The hybrid/EV battery pack coolant system has a level sensor. The hybrid/EV battery pack coolant level sensor is attached to the coolant surge tank. The level sensor is a 2-state bi-metallic reed switch which changes state when the switch reed is exposed to magnetism. The level of the hybrid/EV battery pack coolant in the surge tank causes a magnet-equipped float to move towards and away from the sensor as coolant level decreases or increases. The hybrid/EV powertrain control module 2 supplies 5 V to the signal circuit and a ground for the low reference circuit. The hybrid/EV battery pack coolant level sensor resistance decreases when the battery coolant level in the surge tank gets low. The hybrid/EV powertrain control module 2 uses the hybrid/EV battery pack coolant level sensor to determine if disabling the hybrid/EV battery pack because the coolant system is low on coolant.

Conditions for Running the DTC

P1FFB, P1FFC, and P1FFD

The 12 V battery voltage is greater than or equal to 10.2 V.

P1FFE

- The vehicle speed is zero for more than 40 s.

  AND

- The battery pack temperature is less than -7Â°C (+32Â°F) for greater than 30 s.
- None of the following DTCs are set: P0ABC, P0ABD, P0ABB, P0721, P077B, P1FFB, P1FFC, P1FFD, P1FFE, P215C, P2610, U0100, U0101, U0111, or U185A.

Conditions for Setting the DTC

P1FFB

The Hybrid/EV Battery Pack Coolant Level Sensor voltage is between 2.8 - 3.1 V

P1FFC

The Hybrid/EV Battery Pack Coolant Level Sensor voltage is below 1.37 V

P1FFD

The Hybrid/EV Battery Pack Coolant Level Sensor voltage is above 4.0 V

P1FFE

The Hybrid/EV Battery Pack Coolant Level Sensor voltage is between 1.38 - 2.84 V for more than 2 consecutive key cycles

Action Taken When the DTC Sets

- DTC P1FFB, P1FFC, P1FFD, and P1FFE are type A DTCs.
- Hybrid/EV Battery Pack charging is disabled.

Conditions for Clearing the DTC

DTC P1FFB, P1FFC, and P1FFD are type A DTCs.

Circuit/System Verification

1. Verify that the vehicle hybrid/EV battery cooling system is full.
   - **If the hybrid/EV battery cooling system is low**

     WARNING: **Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.**

     Refer to **Hybrid Cooling System Loss of Coolant (Drive Motor Battery Cooling System)Hybrid Cooling System Loss of Coolant (Drive Motor Generator Power Inverter Module Cooling System)** for the Drive Motor Battery Cooling System

   - **The hybrid/EV battery cooling system is full**

     Refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B258 Hybrid/EV Battery Coolant Level Sensor.
2. Test for less than 10 Ω between the low reference circuit terminal B and ground.

- **If 10 Ω or greater**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If less than 10 Ω**

3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V signal circuit terminal A and ground.
    - **If 5.2 V or greater**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 4.8 V or less**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If within the specified range**
5. Vehicle OFF, remove the B258 Hybrid/EV Battery Coolant Level Sensor from the coolant surge tank
6. Test for 24 - 25.4k Ω between the signal terminal A and the low reference terminal B.
    - **If not within the specified range**

      Replace the B258 Hybrid/EV Battery Coolant Level Sensor.

    - **If within the specified range**

NOTE: **Moving the magnet slightly along the bottom of the sensor will assist closing the internal switch.**

7. Using a magnet, place the magnet off center of the sensor, opposite of the terminals on the epoxy side, test for 7.1 - 7.54k Ω between the signal terminal A and the low reference terminal B.
    - **If not within the specified range**

      Replace the B258 Hybrid/EV Battery Coolant Level Sensor.

    - **If within the specified range**
8. Replace the coolant surge tank.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Drive Motor Battery Coolant Level Sensor Replacement for B258 Hybrid/EV battery coolant level sensor replacement.
- Refer to Radiator Surge Tank Replacement
- Refer to Control Module References for K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P1FFF: SYSTEM ISOLATION/COOLANT LEVEL SENSOR FAULT - HYBRID/EV BATTERY CHARGING SYSTEM DISABLED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1FFF

System Isolation/Coolant Level Sensor Fault - Hybrid/EV Battery Charging System Disabled

Circuit/System Description

This diagnostic is an indicator that hybrid/EV battery pack charging is disabled because the hybrid/EV powertrain control module 2 detected one of the following conditions:

WARNING: **Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.**

- A loss of isolation between the hybrid/EV battery pack high voltage circuits and vehicle chassis
- A low coolant condition of the hybrid/EV battery pack coolant system
- A fault in the hybrid/EV battery pack coolant level sensor/circuit

Conditions for Running the DTC

- The hybrid powertrain control module 2 and battery energy control module are awake and communicating.
- Once set, the DTC will not run again until a scan tool clear code command is sent.

Conditions for Setting the DTC

NOTE: **DTC P1FFF will never set alone.**

When DTC P0AA6, P1AE6, P1FFB, P1FFC, P1FFD, or P1FFE is set, DTC P1FFF will also be set.

Action Taken When the DTC Sets

- DTC P1FFF is a type A DTC.
- The driver information center displays the SERVICE HIGH VOLTAGE CHARGING SYSTEM message.
- Hybrid/EV battery pack charging will be reduced.

Conditions for Clearing the DTC

DTC P1FFF is a type A DTC but will only clear with a scan tool clear code command.

Diagnostic Aids

DTC P1FFF will not clear or go to history with ignition cycles once DTC is set. DTC P1FFF will only clear with a clear code command from the scan tool.

   - **If none of the DTCs are set**
5. All OK.

HYBRID/EV ELECTRONICS COOLING DIAGNOSTIC (DRIVE MOTOR GENERATOR POWER INVERTER MODULE COOLING SYSTEM)

Step	Action	Yes	No
1	Were you sent here from Symptoms or another diagnostic table?	Go to **Step 2**	Go to **Diagnostic System Check - Vehicle**

Step	Action	Yes	No
2	**WARNING:** **Refer to Moving Parts and Hot Surfaces Warning .** **WARNING:** **Wear safety glasses in order to avoid eye damage.** 1. Add coolant to the coolant surge tank as needed. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**. 2. Using GDS, turn on the hybrid electronics coolant pump and increase the RPM to 1000. 3. Quickly remove and instal the generator control module coolant tank hose from the automatic transmission. Refer to **Generator Control Module Coolant Tank Hose Replacement (DU To Surge Tank)** Is there coolant flowing out of the automatic transmission?	Go to **Step 14**	Go to **Step 3**
3	Quickly remove and install the drive motor power inverter module cooling inlet hose from the automatic transmission. Refer to **Drive Motor Power Inverter Module Cooling Inlet Hose Replacement (OBCM To DU)** Is there coolant flowing out of the drive motor power inverter module cooling inlet hose?	Go to **Step 16**	Go to **Step 4**
4	Quickly remove and install the drive motor power inverter module cooling inlet hose from the drive motor battery charger. Refer to **Drive Motor Power Inverter Module Cooling Inlet Hose Replacement (OBCM To DU)** Is there coolant flowing out of the drive motor battery charger?	Go to **Step 18**	Go to **Step 5**
5	Quickly remove and install the electric differential drive motor power inverter module cooling hose from the drive motor battery charger. Refer to **Electric Differential Drive Motor Power Inverter Module Cooling Hose Replacement (APM To OBCM)** Is there coolant flowing out of the electric differential drive motor power inverter module cooling hose?	Go to **Step 19**	Go to **Step 6**
6	Quickly remove and install the electric differential drive motor power inverter module cooling hose from the accessory DC power control module. Refer to **Electric Differential Drive Motor Power Inverter Module Cooling Hose Replacement (APM To OBCM)** Is there coolant flowing out of the accessory DC power control module?	Go to **Step 21**	Go to **Step 7**
7	Quickly remove and install the drive motor generator control module cooling outlet hose from the accessory DC power control module. Refer to **Drive Motor Generator Control Module Cooling Outlet Hose Replacement (SPIM To APM)** Is there coolant flowing out of the drive motor generator control module cooling outlet hose?	Go to **Step 22**	Go to **Step 8**

Step	Action	Yes	No
8	Quickly remove and install the drive motor generator control module cooling outlet hose from the drive motor power inverter module. Refer to **Drive Motor Generator Control Module Cooling Outlet Hose Replacement (SPIM To APM)** Is there coolant flowing out of the drive motor power inverter module?	Go to **Step 24**	Go to **Step 9**
9	Quickly remove and install the drive motor generator control module radiator outlet hose from the drive motor power inverter module. Refer to **Drive Motor Generator Control Module Radiator Outlet Hose Replacement (Radiator To SPIM)** Is there coolant flowing out of the drive motor generator control module radiator outlet hose?	Go to **Step 25**	Go to **Step 10**
10	Quickly remove and install the drive motor generator control module radiator outlet hose from the radiator. Refer to **Drive Motor Generator Control Module Radiator Outlet Hose Replacement (Radiator To SPIM)** Is there coolant flowing out of the drive motor battery coolant radiator?	Go to **Step 27**	Go to **Step 11**
11	Quickly remove and install the drive motor generator control module radiator inlet hose from the radiator. Refer to **Drive Motor Generator Control Module Radiator Inlet Hose Replacement (Pump To Radiator)** Is there coolant flowing out of the drive motor generator control module radiator inlet hose?	Go to **Step 28**	Go to **Step 12**
12	Quickly remove and install the drive motor generator control module radiator inlet hose from the generator control module coolant pump. Refer to **Drive Motor Generator Control Module Radiator Inlet Hose Replacement (Pump To Radiator)** Is there coolant flowing out of the generator control module coolant pump?	Go to **Step 29**	Go to **Step 13**
13	Replace the drive motor battery coolant pump (PE Pump). Refer to **Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump)** Is the repair complete?	Go to **Step 30**	Go to **Step 1**
14	Inspect for kinks or obstructions in the generator control module coolant tank hose or the drive motor generator control module coolant pump hose. Refer to **Generator Control Module Coolant Tank Hose Replacement (DU To Surge Tank)**, or **Drive Motor Generator Control Module Coolant Pump Hose Replacement (Surge Tank To Pump)** Is there a kink or obstruction?	Go to **Step 15**	Go to **Step 1**
15	Replace the generator control module coolant tank hose or the drive motor generator control module coolant pump hose. Refer to **Generator Control Module Coolant Tank Hose Replacement (DU To Surge Tank)**, or **Drive Motor Generator Control Module Coolant Pump Hose Replacement (Surge Tank To Pump)** Is the repair complete?	Go to **Step 30**	Go to **Step 1**

Step	Action	Yes	No
16	1. Using GDS, turn off the hybrid electronics coolant pump. 2. Remove the generator control module coolant tank hose from the automatic transmission. Refer to **Generator Control Module Coolant Tank Hose Replacement (DU To Surge Tank)** 3. Remove the drive motor power inverter module cooling inlet hose from the automatic transmission. Refer to **Drive Motor Power Inverter Module Cooling Inlet Hose Replacement (OBCM To DU)** 4. Back flush the automatic transmission cooling passages. 5. Install the generator control module coolant tank hose to the automatic transmission. Refer to **Generator Control Module Coolant Tank Hose Replacement (DU To Surge Tank)** 6. Install the drive motor power inverter module cooling inlet hose to the automatic transmission. Refer to **Drive Motor Power Inverter Module Cooling Inlet Hose Replacement (OBCM To DU)** 7. Using GDS, turn on the hybrid electronics coolant pump and increase the RPM to 1000. 8. Quickly remove and install the generator control module coolant tank hose from the automatic transmission. Refer to **Generator Control Module Coolant Tank Hose Replacement (DU To Surge Tank)** Is there coolant flowing out of the automatic transmission?	Go to **Step 30**	Go to **Step 17**
17	Replace the automatic transmission. Refer to **Transmission Replacement** . Is the repair complete?	Go to **Step 30**	Go to **Step 1**
18	Replace the drive motor power inverter module cooling inlet hose. Refer to **Drive Motor Power Inverter Module Cooling Inlet Hose Replacement (OBCM To DU)** Is the repair complete?	Go to **Step 30**	Go to **Step 1**

Step	Action	Yes	No
19	1. Using GDS, turn off the hybrid electronics coolant pump. 2. Remove the drive motor power inverter module cooling inlet hose from the drive motor battery charger. Refer to **Drive Motor Power Inverter Module Cooling Inlet Hose Replacement (OBCM To DU)** 3. Remove the electric differential drive motor power inverter module cooling hose from the drive motor battery charger. Refer to **Electric Differential Drive Motor Power Inverter Module Cooling Hose Replacement (APM To OBCM)** 4. Back flush the drive motor battery charger cooling passages. 5. Install the drive motor power inverter module cooling inlet hose to the drive motor battery charger. Refer to **Drive Motor Power Inverter Module Cooling Inlet Hose Replacement (OBCM To DU)** 6. Install the electric differential drive motor power inverter module cooling hose to the drive motor battery charger. Refer to **Electric Differential Drive Motor Power Inverter Module Cooling Hose Replacement (APM To OBCM)** 7. Using GDS, turn on the hybrid electronics coolant pump and increase the RPM to 1000. 8. Quickly remove and install the drive motor power inverter module cooling inlet hose from the drive motor battery charger. Refer to **Drive Motor Power Inverter Module Cooling Inlet Hose Replacement (OBCM To DU)** Is there coolant flowing out of the drive motor battery charger?	Go to **Step 30**	Go to **Step 20**
20	Replace the drive motor battery charger. Refer to **Drive Motor Battery Charger Replacement (Except Dubai)** **Drive Motor Battery Charger Replacement (Dubai)** Is the repair complete?	Go to **Step 30**	Go to **Step 1**
21	Replace the electric differential drive motor power inverter module cooling hose. Refer to **Electric Differential Drive Motor Power Inverter Module Cooling Hose Replacement (APM To OBCM)** Is the repair complete?	Go to **Step 30**	Go to **Step 1**

Step	Action	Yes	No
22	1. Using GDS, turn off the hybrid electronics coolant pump. 2. Remove the electric differential drive motor power inverter module cooling hose from the accessory DC power control module. Refer to **Electric Differential Drive Motor Power Inverter Module Cooling Hose Replacement (APM To OBCM)** 3. Remove the drive motor generator control module cooling outlet hose from the accessory DC power control module. Refer to **Drive Motor Generator Control Module Cooling Outlet Hose Replacement (SPIM To APM)** 4. Back flush the accessory DC power control module cooling passages. 5. 16	Replace the drive motor battery coolant cooler. Refer to **Drive Motor Battery Coolant Cooler Replacement** Is the repair complete?	Go to **Step 19**	Go to **Step 1**
17	Replace the drive motor battery radiator outlet hose. Refer to **Drive Motor Battery Radiator Outlet Hose Replacement (Surge Tank To Chiller)** Is the repair complete?	Go to **Step 19**	Go to **Step 1**
18	Replace the drive motor battery coolant pump inlet hose. Refer to **Drive Motor Battery Coolant Pump Inlet Hose Replacement (Surge Tank To Pump)** Is the repair complete?	Go to **Step 19**	Go to **Step 1**
19	1. Add coolant to the coolant surge tank as needed. Refer to **Drive Motor Battery Cooling System Draining and Filling** 2. Operate the system in order to verify the repair. Is there coolant flowing out of the drive motor battery coolant pump?	System OK	Go to **Step 1**

HYBRID/EV BATTERY PACK COOLANT PUMP MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The hybrid/EV battery pack coolant pump circulates coolant through the drive motor battery coolant radiator, drive motor battery coolant cooler, and the hybrid/EV battery pack to control the temperature of the hybrid/EV battery pack. An enable signal from the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump provides overall control of the pump. When this circuit is high, the pump can operate. The pump is controlled with a pulse-width modulated signal from the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump. The higher the duty cycle the higher the pump speed. The hybrid/EV battery pack coolant pump provides a hard-wired pulse-width modulated feedback signal to the hybrid/EV powertrain control module 2. During normal operation, this feedback signal provides pump speed information to the hybrid/EV powertrain control module 2. The hybrid/EV battery pack coolant pump has some self-diagnostic capability. If the hybrid/EV battery pack coolant pump determines there is an internal fault it provides this information on this same feedback circuit instead of pump speed information.

Diagnostic Aids

A malfunctioning coolant pump may cause a battery pack overheat condition.

Circuit/System Verification

1. Vehicle On.
2. Verify that DTC P0C43, P0C44, P0C45, P0CE0, P0CE2, P0CE3, P0D0A, P0D11, P1EBC, P1EC3, P1EC4, P1EC5, P1EC6, P1EC7, P1EC8, U0111, U185B, or U2602 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**
    - **If none of the DTCs are set**
3. With the Hybrid/Ev Battery Pack Coolant Pump disabled and not running, verify the scan tool parameters listed below:
    - Hybrid/EV Battery Pack Coolant Pump Command is less than 10%.

    - Hybrid/EV Battery Pack Coolant Pump Feedback is 0%.
    - Hybrid/EV Battery Pack Coolant Pump Speed is 25 RPM.
    - **The scan tool parameters listed are not the specified values**

      Refer to Circuit/System Testing.

    - **The scan tool parameters listed are within the specified values**
4. Set the vehicle Charge Mode to IMMEDIATE.
5. Vehicle OFF, connect the charge cord set.
6. With the vehicle charging, the hybrid/EV battery pack coolant pump enabled and not running, verify the scan tool parameters listed below:
    - Hybrid/EV Battery Pack Coolant Pump Command is 10%.
    - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
    - Hybrid/EV Battery Pack Coolant Pump Speed is 50 RPM.
    - **The scan tool parameters listed are not the specified values**

      Refer to Circuit/System Testing.

    - **The scan tool parameters listed are within the specified values**
7. Command the Hybrid/EV Battery Pack Coolant Pump to 90%, verify the scan tool parameters listed below:
    - Hybrid/EV Battery Pack Coolant Pump Command to be greater than 10%.
    - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
    - Hybrid/EV Battery Pack Coolant Pump Speed is greater than 50 RPM.
    - **The scan tool parameters listed are not the specified values**

      Refer to Circuit/System Testing.

    - **The scan tool parameters listed are within the specified values**
8. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G37 Hybrid/EV Battery Pack Coolant Pump.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**

      Repair the open/high resistance on the ground circuit.

    - **If less than 10 Ω**
3. Vehicle On.
4. Test for greater than 11.5 V between the B+ circuit terminal 5 and the ground circuit terminal 4.
    - **If 11.5 V or less**
    1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω and the fuse is blown, replace the G37 Hybrid/EV Battery Pack Coolant Pump.
    - **If greater than 11.5 V**
5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.
6. Command the Hybrid Battery Pack Coolant Pump Command OFF (10%) and ON (90%) with a scan tool. The test lamp should turn OFF and ON when changing between the commanded states.
    - **If the test lamp is always illuminated at 10%**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle On.
    2. Test for less than 1 V between the enable circuit terminal and ground.

      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp does not illuminate at 90%**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the enable circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the enable circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp turns OFF and ON when changing between the commanded states**
7. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
8. Command the Hybrid Battery Pack Coolant Pump Command ON between 20% and 90% with a scan tool. Verify that a test lamp changes illumination between bright (20%) and dim (90%) between the control circuit terminal 3 and the B+ circuit terminal 5.
   - **If the test lamp is always dim or does not illuminate**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle On.
   2. Test for less than 1 V between the control circuit terminal and ground
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Vehicle OFF.
   4. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is always bright**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **The test lamp changes illumination between bright (20%) and dim (90%)**
9. Command the Hybrid Battery Pack Coolant Pump Command OFF.
10. Verify the scan tool, Hybrid Battery Pack Coolant Pump Feedback parameter is less than 10%.
   - **If 10% or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 10%**
11. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
12. Verify the scan tool, Hybrid Battery Pack Coolant Pump Feedback parameter is greater than 90%.
   - **If less than 90%**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 1 V between the feedback circuit terminal and ground.

        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 90% or greater**

13. Replace the G37 Hybrid/EV Battery Pack Coolant Pump.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump)**
- Refer to **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming and setup.

HYBRID/EV ELECTRONICS COOLANT PUMP MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The hybrid/EV electronics coolant pump circulates coolant through the power electronics coolant radiator, hybrid/EV powertrain control module 1, and the battery charger to control the temperature of the hybrid/EV powertrain control module 1 and the battery charger. An enable signal from the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump provides overall control of the pump. When this circuit is high, the pump can operate. The pump is controlled with a pulse-width modulated signal from the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump. The higher the duty cycle the higher the pump speed. The hybrid/EV electronics coolant pump provides a hard-wired pulse-width modulated feedback signal to the hybrid/EV powertrain control module 2. During normal operation, this feedback signal provides pump speed information. The hybrid/EV electronics coolant pump has some self-diagnostic capability. If it determines there is an internal fault it provides this information on this same feedback circuit instead of pump speed information.

Circuit/System Verification

1. Vehicle On
2. Verify that DTC P0C43, P0C44, P0C45, P0C47, or P1EC6 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If none of the DTCs are set**
3. Vehicle On.
4. With a scan tool, verify that the Hybrid/EV Electronics Coolant Pump Command is between 20%-90% and Hybrid Electronics Coolant Pump Feedback is 50% +/-5%.
    - **The readings are not within the specified range**

      Refer to Circuit/System Testing.

    - **The readings are within the specified range**
5. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G35 Hybrid/EV Electronics Coolant Pump.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**

      Repair the open/high resistance on the ground circuit.

    - **If less than 10 Ω**
3. Vehicle On.
4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.
    - **If less than B+**
    1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω and the fuse is blown, replace the G35 Hybrid/EV Electronics Coolant Pump.
    - **If B+**
5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.
6. Command the Hybrid/EV Electronics Coolant Pump OFF (10%) and ON (90%) with a scan tool. The test lamp should turn OFF and ON when changing between the commanded states.
    - **If the test lamp is always illuminated at 10%**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle On.
    2. Test for less than 1 V between the enable circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp does not illuminate at 90%**

    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the enable circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the pump enable circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp turns OFF and ON when changing between the commanded states**

7. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
8. Command the Hybrid/EV Electronics Coolant Pump ON between 20% and 90% with a scan tool. Verify that a test lamp changes illumination between bright (20%) and dim (90%) between the control circuit terminal 3 and the B+ circuit terminal 5.
    - **If the test lamp is always dim or does not illuminate**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle On.
    2. Test for less than 1 V between the control circuit terminal and ground
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp is always bright**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **The test lamp changes illumination between bright (20%) and dim (90%)**
9. Remove the test lamp.
10. Verify the scan tool, Hybrid/EV Electronics Coolant Pump Feedback parameter is less than 10%.
    - **If greater than 10%**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 10%**
11. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
12. Verify the scan tool, Hybrid/EV Electronics Coolant Pump Feedback parameter is greater than 90%.
    - **If less than 90%**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle On.
    2. Test for less than 1 V between the feedback circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If 90% or greater**

13. Replace the G35 Hybrid/EV Electronics Coolant Pump.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump)**
- Refer to **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming and setup.

COOLING FAN MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The Hybrid/EV Powertrain Control Module 2 controls the radiator cooling fan. The cooling fan are controlled with a pulse width modulated signal. The Hybrid/EV Powertrain Control Module 2 diagnoses any faults with the hardwire circuit to the engine control module. The engine control module sends a fan request pulse width modulated signal to the Hybrid/EV Powertrain Control Module 2 through a hardwire circuit. The Hybrid/EV Powertrain Control Module 2 operates in a pass-through mode for the engine control module fan request. The higher the duty cycle the higher the cooling fan speed.

The Hybrid/EV Powertrain Control Module 2 sends a request to the engine control module for the cooling fan to be enabled. The engine control module uses this request and other vehicle inputs to decide if and what speed the cooling fan should operate. The engine control module sends the cooling fan command to the hybrid/EV powertrain control module 2. The Hybrid/EV Powertrain Control Module 2 sends the signal to the cooling fan to operate and at what speed.

If the vehicle is in Charge Mode and the Hybrid/EV Powertrain Control Module 2 requests the cooling fan to operate, if the engine control module is not awake, the Hybrid/EV Powertrain Control Module 2 will control the cooling fan. If active cooling is needed, the engine control module wakes up to operate the air conditioning control module and then the engine control module is the master controller for the fan.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Command the Cooling Fan Motor Command to 90% with a scan tool. Verify that the cooling fan is operating.
    - **The cooling fan is not operating**

      Refer to Circuit/System Testing

    - **The cooling fan is operating**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G10 Cooling Fan Motor.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**

      Test the ground circuit for an open/high resistance.

    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for B+ between the B+ circuit terminal 1 and ground.
    - **If less than B+**
    1. Vehicle OFF, test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω and the fuse is blown, replace the G10 Cooling Fan Motor.
    - **If B+**
5. Connect a test lamp between the control circuit terminal 4 and the B+ circuit terminal 1.
6. Command the Cooling Fan Motor Command ON between 10% and 90% with a scan tool. Verify the test lamp changes between dim (10%) and bright (90%).
    - **If the test lamp is always dim or does not illuminate**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 1 V between the control circuit and ground
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp is always bright**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **The test lamp changes illumination between bright (20%) and dim (90%)**
7. Replace the G10 Cooling Fan Motor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Cooling Fan and Shroud Replacement
- Refer to Control Module References for hybrid/EV powertrain control module 2 replacement, programming and setup.

HYBRID COOLING SYSTEM LOSS OF COOLANT (DRIVE MOTOR BATTERY COOLING SYSTEM)

Step	Action	Yes	No
DEFINITION: Perform this procedure in conjunction with a high-voltage battery overheating condition, low coolant in the high-voltage battery surge tank, or when instructed to by DTC P1AE6, or P0AA6 diagnostic procedures. **WARNING:** **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:** **• Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors** **• Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors** ** – Visually and functionally inspect the gloves before use.** ** – Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.** **Failure to follow the procedure exactly as written may result in serious injury or death.** **WARNING:** **Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.**			
1	Raise and support the hood with prop rod. Was the hood raised and supported with the prop rod?	Go to **Step 2**	Go to **Step 1**
2	Visually inspect the coolant level in the high-voltage battery surge tank. Is the coolant level at or above the seam on the side of the surge tank?	Go to **Step 3**	Go to **Step 4**
3	Are any of the following DTCs present? • P0AA6 (Hybrid/EV Battery Voltage System Isolation Lost) • P1AE6 (Battery Energy Control Module Hybrid/EV Battery Voltage Isolation Sensor Circuit)	Perform DTC Diagnostics.	Go to **Step 4**
4	Call the GM Technical Assistance Center (TAC) for further instructions. Refer to **DO NOT ATTEMPT TO REPAIR VEHICLE WITHOUT CALLING TAC.** Was TAC called?	Go to **Step 5**	Go to **Step 4**

Step	Action	Yes	No
5	Special Tools: • EN-24460-A cooling system pressure tester • GE-46143-2 radiator cap and surge tank test adapter Pressure test high-voltage battery cooling loop and pressure cap to 34.4 kPa (5 psi). Does the system hold pressure for at least 5 minutes?	Go to **Step 9**	Go to **Step 6**
6	**NOTE:** **When raising vehicle on hoist, vehicle must be level.** Visually inspect the following components. Also inspect their hoses, clamps, and hose connections for coolant leaks: • Coolant surge tank • HV battery coolant pump • HV battery chiller • HV battery assembly Was a coolant leak found?	Replace component(s), hose(s), or clamp(s) that is/are leaking. Refer to appropriate procedure(s). Validate repair with additional pressure test. Then Go to **Step 9**	Go to **Step 7**
7	If no external leaks are found ensure leak is not coming from test equipment. Is equipment faulty?	Repair Equipment. Go to **Step 6**	Go to **Step 8**
8	Visually inspect the following components internal to the drive motor battery. Also inspect their hoses, clamps, and hose connections for coolant leaks: • Battery Heater • Cell Battery Cooling Manifold Inlet Hose • Cell Battery Cooling Manifold Outlet Hose • Coolant Temperature Sensor Is leak repair complete?	Go to **Step 9**	Go to **Step 5**
9	Special Tools: • GE-26568 Coolant and Battery Tester • GE-47716-A Vac-N-Fill Coolant Refill Tool • GE-46143-2 Radiator Cap and Surge Tank Test Adapter Fill and adjust high-voltage battery cooling system level at the surge tank. Refer to **Drive Motor Battery Cooling System Draining and Filling**. Was a coolant leak found?	Go to **Step 10**	Go to **Step 6**
10	Verify the following before returning vehicle to customer: Coolant level is at the top of the seam of the high-voltage battery surge tank. Did you find and correct the condition?	System OK	Go to **Step 1**

HYBRID COOLING SYSTEM LOSS OF COOLANT (DRIVE MOTOR GENERATOR POWER INVERTER MODULE COOLING SYSTEM)

Step	Action	Yes	No
DEFINITION: The power inverter module (PIM) cooling system is losing coolant either internally or externally.			
1	Inspect the coolant level. Is the coolant at the proper level?	Go to **Step 13**	Go to **Step 2**
2	Fill the cooling system to the proper level. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**. Is the action complete?	Go to **Step 3**	-
3	Overheating can cause a loss of coolant. Is the PIM Cooling system overheating?	Go to **Step 11**	Go to **Step 4**
4	Visually inspect the hoses, pipes and hose clamps. Are any of the hoses, clamps or pipes leaking?	Go to **Step 12**	Go to **Step 5**
5	Visually inspect the following components: • Coolant surge tank • Coolant pressure cap • Drive motor generator power inverter module • Accessory DC power control module • Automatic transmission • Radiator • Coolant pump • Coolant valves • Drive motor battery charger Are any of the listed components leaking?	Go to **Step 12**	Go to **Step 6**
6	1. Pressure test the cooling system. Refer to **Hybrid Cooling System Leak Test**. 2. With the cooling system pressurized, visually inspect the components listed in step 5. Are any leaks present?	Go to **Step 12**	Go to **Step 7**
7	Pressure test the coolant pressure cap. Refer to **Hybrid Cooling System Pressure Cap Testing**. Does the coolant pressure cap hold pressure?	Go to **Step 9**	Go to **Step 8**
8	Replace the coolant pressure cap. Is the repair complete?	Go to **Step 13**	-
9	1. Pressure test the cooling system. Refer to **Hybrid Cooling System Leak Test**. 2. With the cooling system pressurized, remove the engine cooling system pressure cap. Does the hybrid cooling system hold pressure?	-	Go to **Step 10**
10	Replace the surge tank. Refer to **Radiator Surge Tank Replacement**. Is the repair complete?	Go to **Step 13**	-
11	Repair the hybrid cooling system overheating condition. Is the repair complete?	Go to **Step 13**	-
12	Repair or replace the leaking component. Refer to the appropriate repair. Is the repair complete?	Go to **Step 13**	-

Step	Action	Yes	No
13	Operate the system in order to verify the repair. **NOTE:** **Do not use stop leak or any other chemicals. Only use premix Dexcool (50/50 mixture of Dexcool and deionized)** Did you find and correct the condition?	System OK	Go to **Step 2**

HYBRID COOLING SYSTEM PRESSURE CAP TESTING

Special Tools

- **GE-46143-2** Radiator Cap and Surge Tank Test Adapter
- **EN-24460-A** Cooling System Pressure Tester

For equivalent regional tools, Refer to Special Tools.

Pressure Cap Testing

WARNING: **To help avoid being burned, do not remove the hybrid cooling system pressure cap while the hybrid cooling system is hot. Scalding fluid and steam can be blown out under pressure if the cap is removed while the system is still hot.**

1. Remove the pressure cap.
2. Wash the pressure cap sealing surface with water.

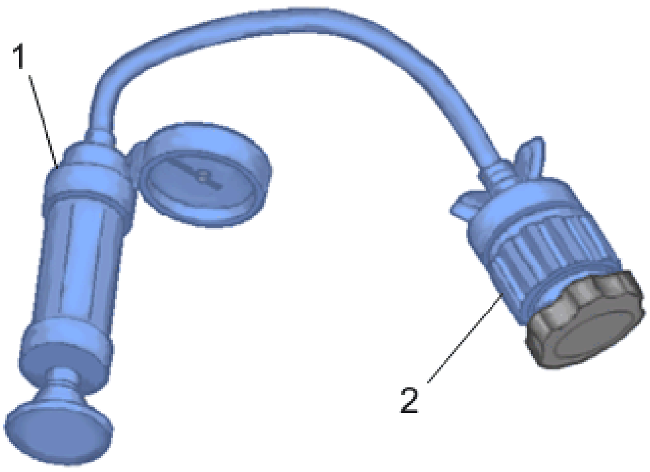

Fig. 5: Cooling System Pressure Tester & Radiator Cap/Surge Tank Test Adapter Kit
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Lubricate GE-46143-2 Radiator Cap and Surge Tank Test Adapter and pressure cap O-rings with coolant and press cap to seat O-ring on GE-46143-2 Radiator Cap and Surge Tank Test Adapter before turning to engage threads.**

3. Use the **EN-24460-A** Cooling System Pressure Tester (1) with **GE-46143-2** Radiator Cap and Surge Tank Test Adapter (2) in order to test the pressure cap.
4. Test the pressure cap for the following conditions:

    - Pressure release when the **EN-24460-A** Cooling System Pressure Tester exceeds the pressure rating of the pressure cap.
    - Maintain the rated pressure for at least 10 seconds.

      Note the rate of pressure loss.

5. Replace the pressure cap under the following conditions:
    - The pressure cap does not release pressure which exceeds the rated pressure of the cap.
    - The pressure cap does not hold the rated pressure.

HYBRID COOLING SYSTEM LEAK TEST

Special Tools

- **EN-24460-A** Cooling System Pressure Tester
- **GE-46143-2** Radiator Cap and Surge Tank Test Adapter

For equivalent regional tools, Refer to **Special Tools**.

WARNING: **Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.**

WARNING: **To help avoid being burned, do not remove the hybrid cooling system pressure cap while the hybrid cooling system is hot. Scalding fluid and steam can be blown out under pressure if the cap is removed while the system is still hot.**

WARNING: **In order to avoid personal injury, do not remove the cap or open the cooling system drains from a hot system. Allow the system to cool first.**

1. Remove the pressure cap.
2. Test the operation of the pressure cap. Refer to **Hybrid Cooling System Pressure Cap Testing**.
3. Wash the pressure cap mating surface with water.

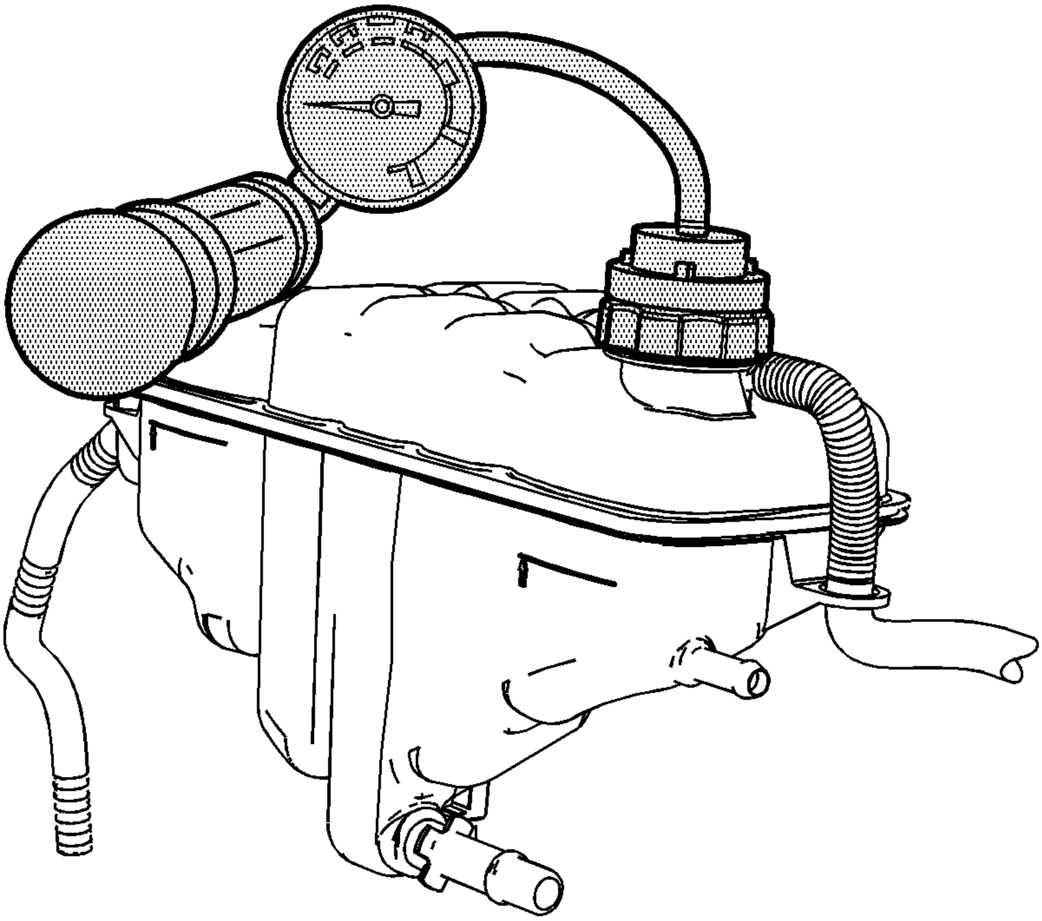

Fig. 6: Cooling System Pressure Tester Components
Courtesy of GENERAL MOTORS COMPANY

4. Use the **EN-24460-A** Cooling System Pressure Tester with the **GE-46143-2** Radiator Cap and Surge Tank Test Adapter in order to apply pressure to the cooling system.

   Do not exceed the pressure cap rating.

5. The cooling system should hold the rated pressure for at least 2 minutes.

   Observe the gauge for any pressure loss.

NOTE: **Do not use stop leak or any other chemicals. Only use premix Dexcool (50/50 mixture of Dexcool and deionized)**

6. Repair any leaks as required.

HYBRID BATTERY PACK COOLANT PASSAGE LEAK TEST

Special Tools

- **EN-24460-A** Cooling System Pressure Tester
- **GE-47716** Vac-N-Fill Coolant Refill Tool
- **EL-52016-A** Battery Pack Coolant Passage Pressure Test Adapter
- **GE-50389** Coolant Pressure Test Quick Connector

For equivalent regional tools, refer to Special Tools.

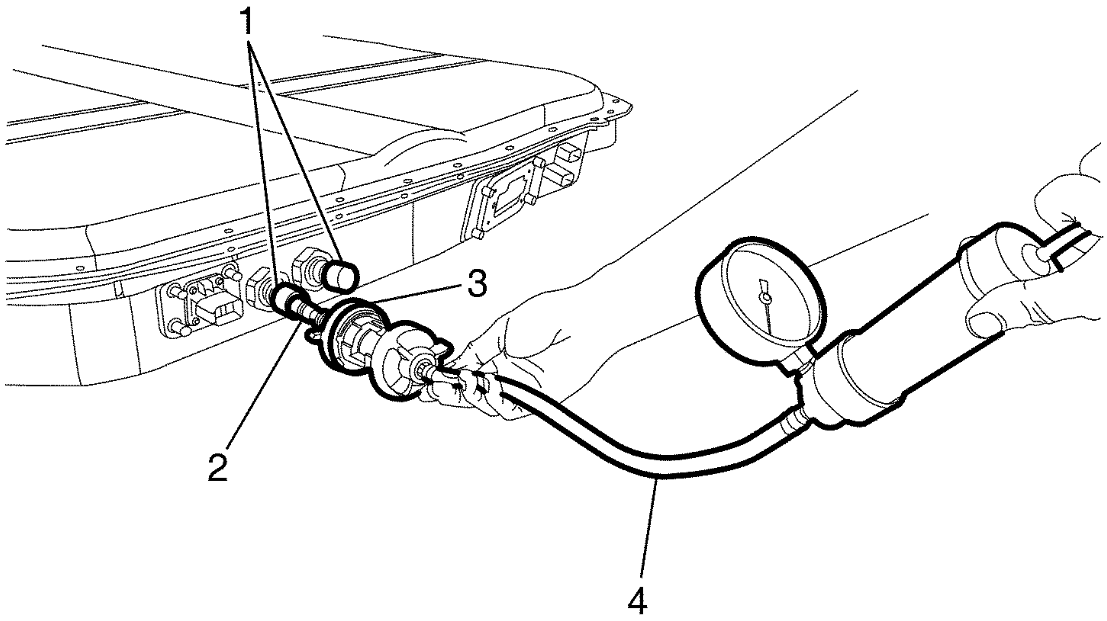

Fig. 7: Cooling System Pressure Tester And Components
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.**

WARNING: **To help avoid being burned, do not remove the hybrid cooling system pressure cap while the hybrid cooling system is hot. Scalding fluid and steam can be blown out under pressure if the cap is removed while the system is still hot.**

WARNING: **In order to avoid personal injury, do not remove the cap or open the cooling system drains from a hot system. Allow the system to cool first.**

1. Install Cooling System Pressure Tester Cap Adapter to **EN-24460-A** Cooling System Pressure Tester (4).
2. Install **GE-47716-8** Vac-N-Fill Cap (3) to Cooling System Pressure Tester Cap Adapter.
3. Install **GE-50389** Coolant Pressure Test Quick Connector (2) to **GE-47716-8** Vac-N-Fill Cap (3).
4. Install **EL-52016-1A** Coolant Pressure Tester Adapter (1) to **GE-50389** Quick Connector (2).
5. Install **EL-52016-1A** Coolant Pressure Tester Adapter (1) to battery pack inlet connector.
6. Install **EL-52016-2A** Coolant Pressure Tester Adapter (1) to battery pack outlet connector.
7. Apply pressure to the battery pack coolant passages.

   Do not exceed the pressure cap rating.

8. The cooling passages should hold the rated pressure for at least 2 minutes.

   Observe the gauge for any pressure loss.

9. Repair any leaks as required.

REPAIR INSTRUCTIONS

HOSE CLAMP REPLACEMENT GUIDELINES - SPRING TYPE

Special Tools

- **BO-38185** Hose Clamp Pliers
- **GE-47622** Hose Clamp Pliers.

Equivalent regional tools: **Special Tools**

Spring Type Hose Clamp Replacement Guidelines

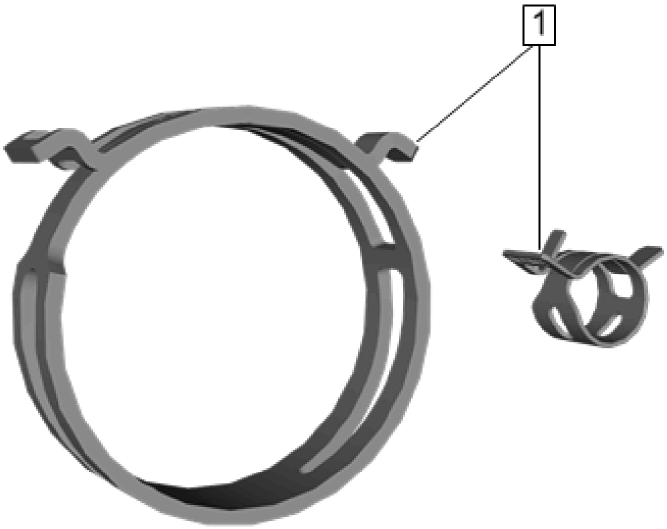

Fig. 8: Spring Type Hose Clamps
Courtesy of GENERAL MOTORS COMPANY

Vehicles utilize spring type hose clamps (1) to secure joints in which fluids, gases, or engine vacuum can travel to various vehicle systems. Spring type hose clamps are engineered to provide the proper amount of tension to maintain a leak & maintenance free joint for the life of the vehicle.

Spring type hose clamps have a special coating applied to the exterior of the clamp that is engineered to resist rust/corrosion, improve durability and increase the life of the hose clamp. If the coating is damaged, rust/corrosion could form resulting in the need to replace the hose clamp.

Many spring type hose clamps within GM utilize a small amount of adhesive placed directly on the hose clamp to secure the clamp to the mating hose for manufacturing purposes. Over time the strength of the adhesive will deteriorate. It is extremely important when a technician is attempting to service a joint or remove the hose clamp, that the clamp is not rotated or repositioned so that is tears and/or damages the hose. In this case, the hose and clamp must both be replaced.

When repairing a vehicle it is very important to observe the condition of both the hose and the spring type hose clamp as well as the orientation of the clamp to the hose.

If the spring type hose clamp(s) have any of the following conditions on any area of the clamp, replace the clamp(s) immediately.

- Rust/Corrosion
- Cracks
- Physical damage
- Leakage attributed to the retention of the clamp

Removing The Spring Type Hose Clamp

While keeping the hose stationary, use BO-38185 Hose Clamp Pliers or GE-47622 Hose Clamp Pliers and release the spring type hose clamp tension while attempting to separate the hose clamp from the hose.

- If the spring type hose clamp will not easily separate from the hose and/or the clamp tears or damages the hose, both the hose and hose clamp must be replaced
- If the spring type hose clamp is easily removed from the hose, the clamp can be reused provided that the clamp does not have any of the conditions as noted above.

If The Spring Type Hose Clamp Is Being Reused

It is extremely important that the spring type hose clamp is orientated to the hose in the exact same position as it was installed during vehicle assembly so that the hose clamp is not damaged or the hose clamp does not contact or damage any adjacent components. Do not use any type of adhesive on the hose clamp prior to installation.

When Reusing The Spring Type Hose Clamp and Replacing The Hose

- The inside and outside hose diameter must be identical between the new hose and the existing hose to guarantee proper hose clamp tension and joint integrity.
- Always place the existing spring type hose clamp in the same orientation as it was positioned prior to separating the joint. The new hose might have a marking on the hose indicating the correct position of a hose clamp, which should re-confirm the correct hose clamp position. The hose clamp should not contact any adjacent components after installation.

When Reusing The Spring Type Hose Clamp with an Existing Hose

Always place the existing spring type hose clamp in the same orientation as it was positioned prior to separating the joint. The existing hose might have an indentation or compression mark on the hose from where the hose clamp was installed previously. The hose clamp should identically overlay this position. The existing hose might also have a marking on the hose indicating the correct position of the hose clamp, which should re-confirm the correct hose clamp position. The hose clamp should not contact any adjacent components after installation.

If The Spring Type Hose Clamp Is Being Replaced

If the hose clamp needs to be replaced, always replace the hose as part of the service repair. It is extremely important that a new spring type hose clamp is orientated to the hose in the exact same position as it was installed during vehicle assembly so that the hose clamp is not damaged or the hose clamp does not contact or damage any adjacent components. Do not use any type of adhesive on the hose clamp prior to installation.

When Replacing The Spring Type Hose Clamp and Replacing The Hose

- The inside and outside hose diameter must be identical between the new hose and the existing hose to guarantee proper hose clamp tension and joint integrity.
- Always place the new spring type hose clamp in the same orientation as it was positioned prior to separating the joint. The new hose might have a marking on the hose indicating the correct position of a hose clamp, which should re-confirm the correct hose clamp position. The hose clamp should not contact any adjacent components after installation.

When Replacing The Spring Type Hose Clamp with an Existing Hose

Always place the new spring type hose clamp in the same orientation as it was positioned prior to separating the joint. The existing hose might have an indentation or compression mark on the hose from where a hose clamp was installed previously. The hose clamp should identically overlay this position. The existing hose might also have a marking on the hose indicating the correct position of the hose clamp, which should re-confirm the correct hose clamp position. The hose clamp should not contact any adjacent components after installation.

DRIVE MOTOR BATTERY COOLING SYSTEM DRAINING AND FILLING

Special Tools

- **GE-26568** Coolant and Battery Tester
- **GE-46143-2** Cooling System Adapter
- **GE-47716** Vac-N-Fill Coolant Refill Tool
- **EL-52016-1A** Battery Pack Coolant Passage Test Adapter

- **EL-52016 - 2A** Coolant Pressure Tester Adapter Plug

Equivalent regional tools: **Special Tools**

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

WARNING: **Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.**

WARNING: **Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.**

WARNING: **To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.**

Draining Procedure

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Remove the radiator surge tank cap.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**

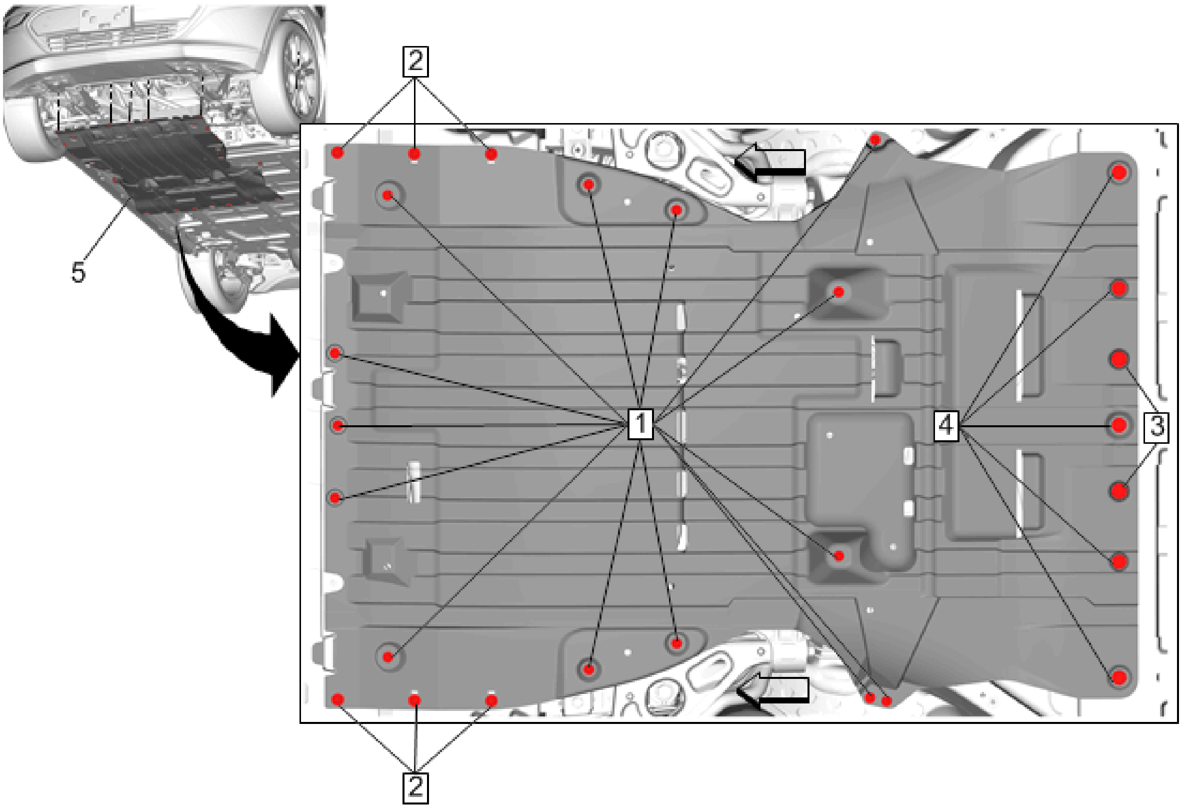

Fig. 9: Front Compartment Air Deflector And Fasteners
Courtesy of GENERAL MOTORS COMPANY

4. Remove Front Compartment Air Deflector (5). Refer to **Front Compartment Air Deflector Replacement**
5. Place a drain pan under the vehicle.

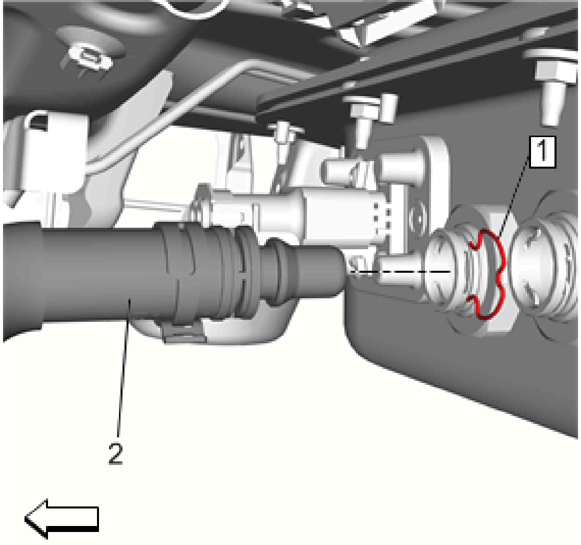

Fig. 10: Battery Vent Hose And Clip
Courtesy of GENERAL MOTORS COMPANY

6. Remove Clip (1)
7. Remove Battery Vent Hose (2)

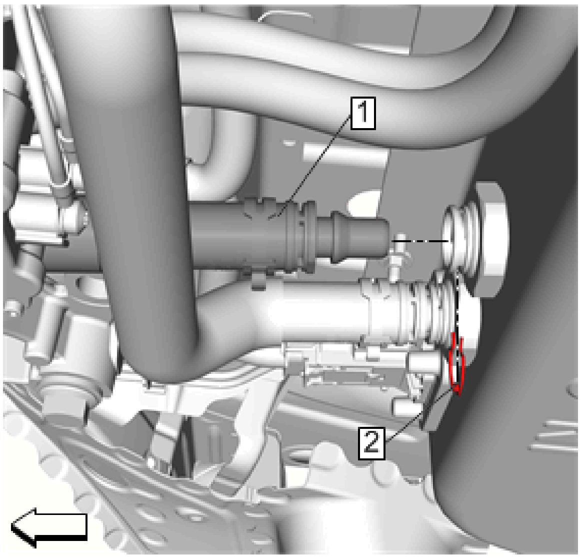

Fig. 11: Drive Motor Battery Coolant Cooler Outlet Hose And Clip (1st Design Battery Pack)
Courtesy of GENERAL MOTORS COMPANY

8. If equipped with the 1st design of battery pack having female inlet and female outlet port, remove the clip (2) and the drive motor battery coolant cooler outlet hose (1) from the RESS.

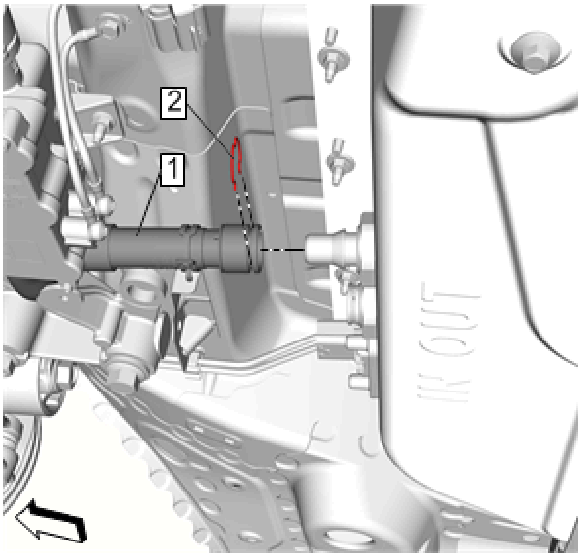

Fig. 12: Drive Motor Battery Coolant Cooler Outlet Hose And Clip (2nd Design Battery Pack)
Courtesy of GENERAL MOTORS COMPANY

9. If equipped with the 2nd design of battery pack having female inlet and male outlet port, remove the clip (2) and the drive motor battery coolant cooler outlet hose (1) from the RESS.
10. Remove the coolant from the drive motor battery cells.
11. Inspect the coolant.

Drive Motor Battery Cell Coolant Removal

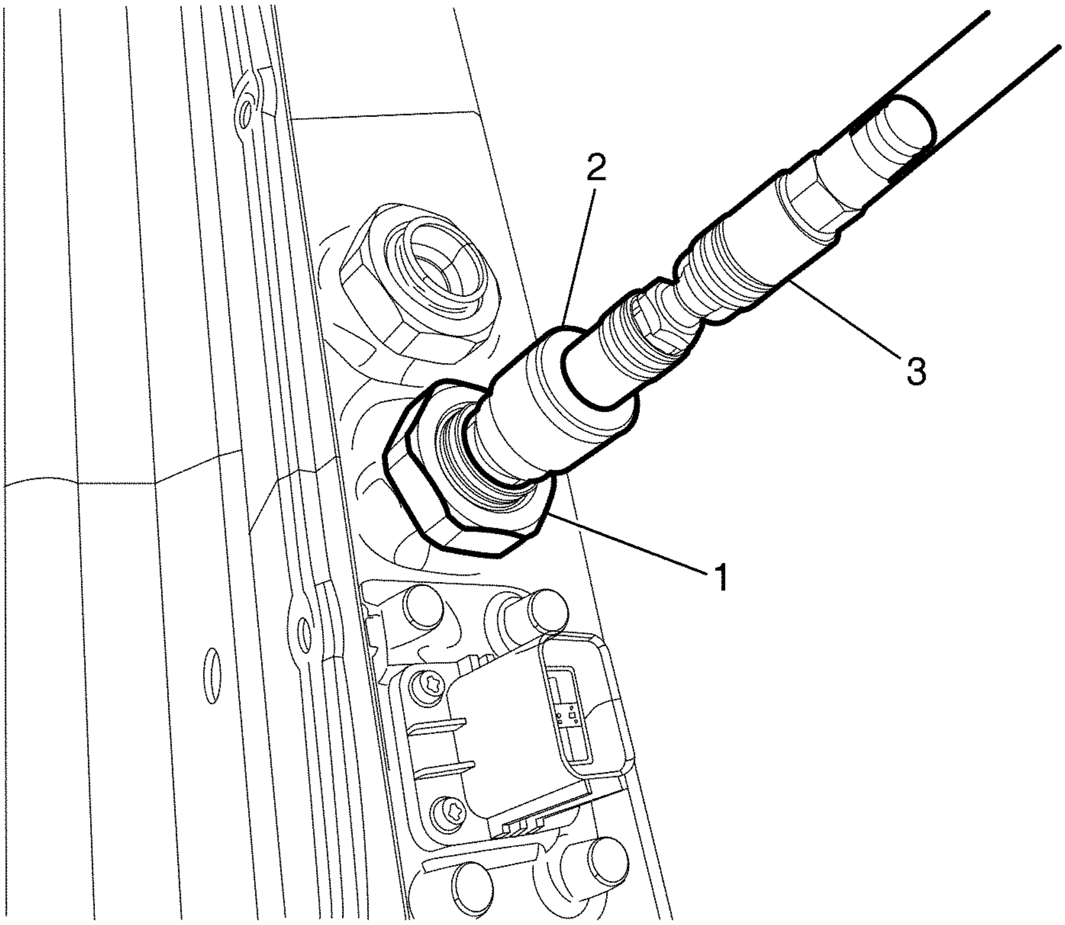

Fig. 13: Battery Pack Coolant Passage Test Adapter, Vac-N-Fill Vacuum Hose And Drive Motor Battery Coolant Inlet
Courtesy of GENERAL MOTORS COMPANY

1. Attach the **EL-52016-1A** Battery Pack Coolant Passage Test Adapter (2) to the drive motor battery coolant Inlet (1).
2. Attach the Vac-N-Fill Vacuum Hose (3) **GE-47716** Vac-N-Fill Coolant Refill Tool to the **EL-52016-1A** Battery Pack Coolant Passage Test Adapter (2).

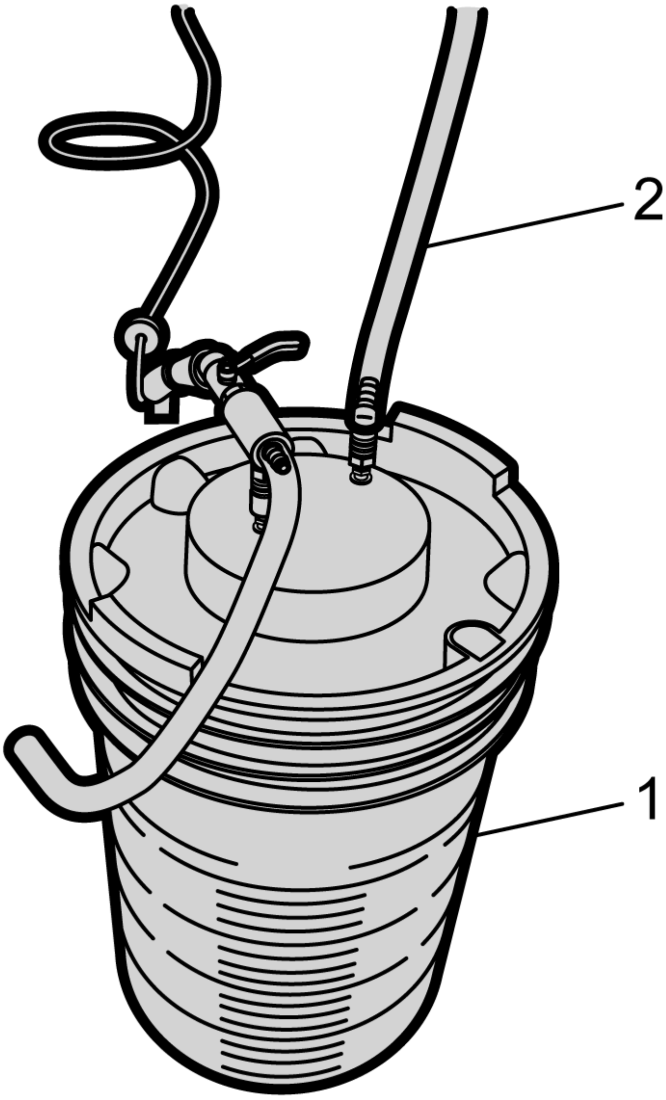

Fig. 14: Vac-N-Fill Vacuum Hose And Tank
Courtesy of GENERAL MOTORS COMPANY

3. Attach the Vac-N-Fill Vacuum Hose (2) to the Vac-N-Fill Vacuum Tank (1) **GE-47716** Vac-N-Fill Coolant Refill Tool.

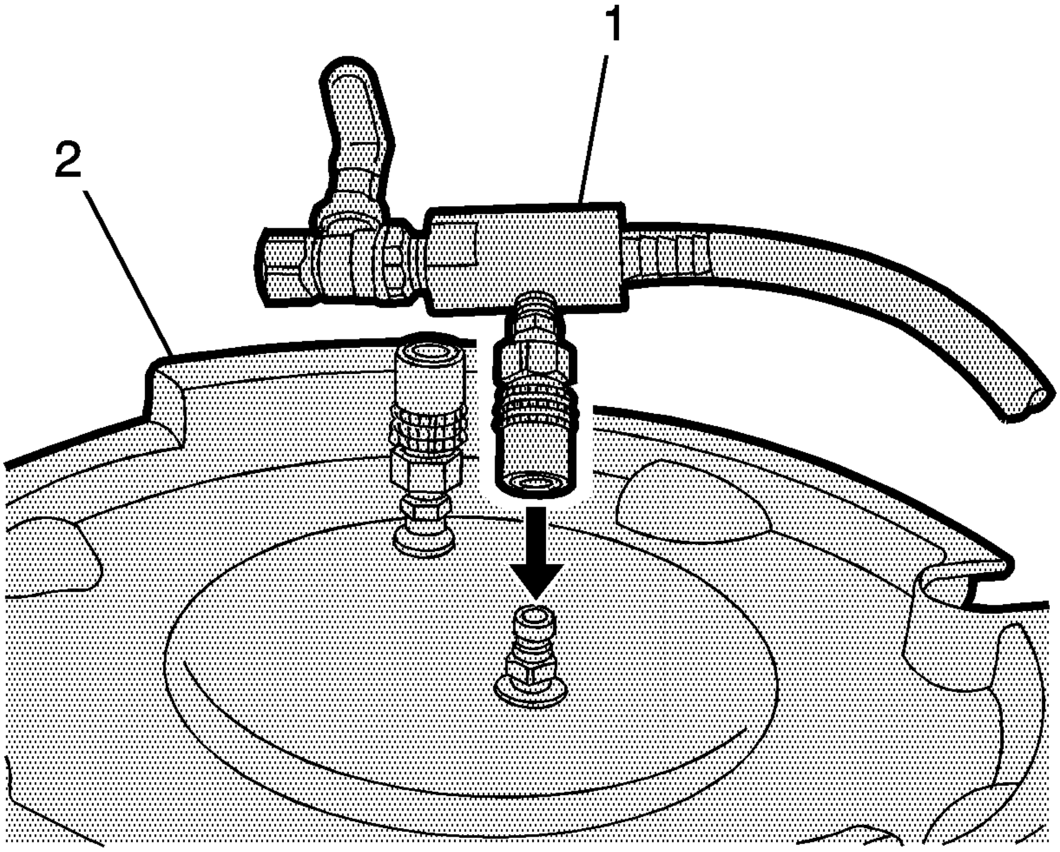

Fig. 15: Vacuum Tank & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Attach the venturi assembly (1) to the vacuum tank (2).

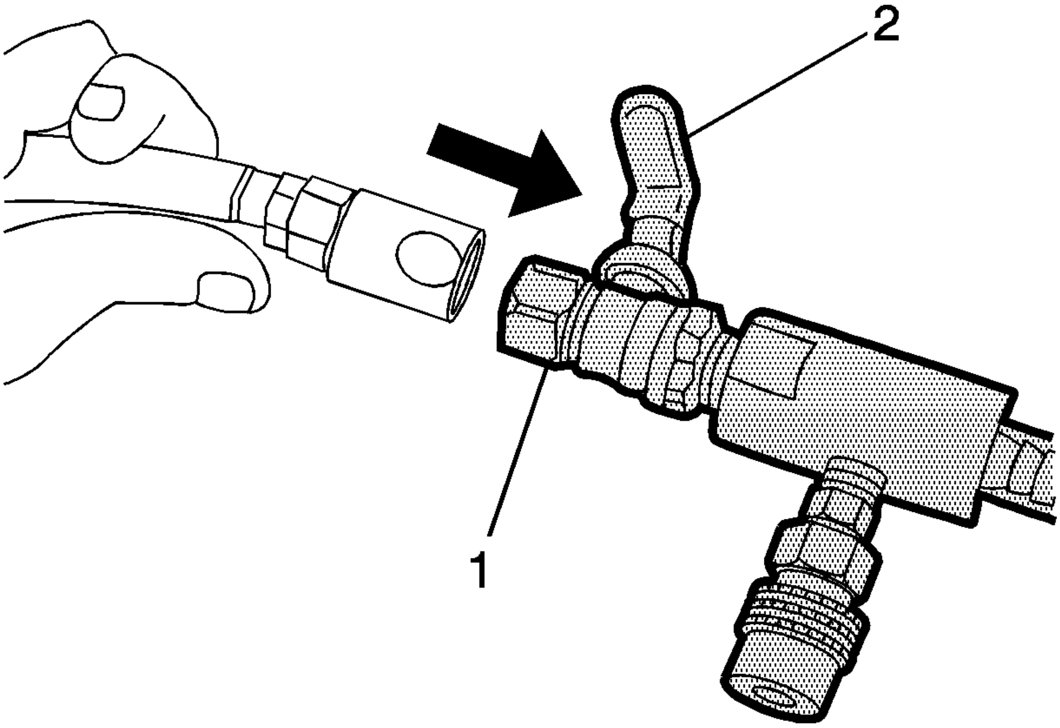

Fig. 16: Venturi Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

5. Attach a shop air hose to the venturi assembly (1).
6. Ensure the valve (2) on the venturi assembly is closed.
7. Ensure the drain valve located on the bottom of the vacuum tank is closed.

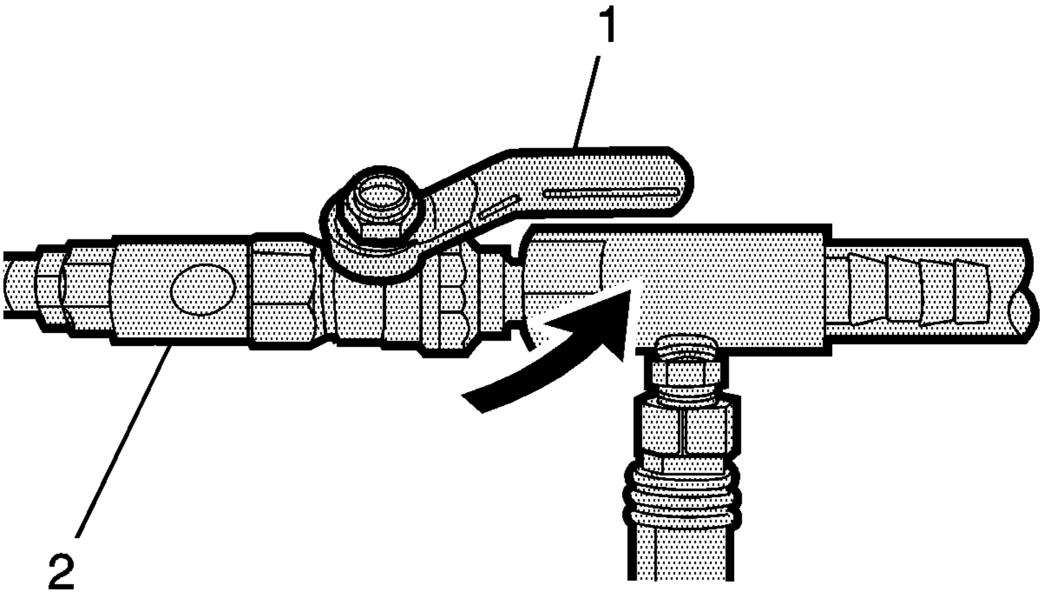

Fig. 17: Valve & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Open the valve (1) on the venturi assembly (2). The vacuum gauge will begin to rise and a hissing noise will be present.

   Coolant will be drawn from the drive motor battery through the vacuum hose and into the vacuum tank.

   Continue to draw coolant from the drive motor battery until there is a continuous mist through the vacuum hose.

9. Install the **EL52016-2A** Battery Pack Coolant Passage Test Adapter, shipping cap or equivalent into the drive motor battery coolant outlet fitting and allow vacuum to build in the drive motor battery for 15-20 seconds.
10. With a vacuum drawn on the drive motor battery cooling system, remove the **EL52016-2A** Battery Pack Coolant Passage Test Adapter, shipping cap or equivalent and allow air to enter the pack to extract additional coolant from the drive motor battery.
11. Repeat steps 7 and 8 until coolant stops draining from the drive motor battery.
12. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

Vac-N-Fill Procedure

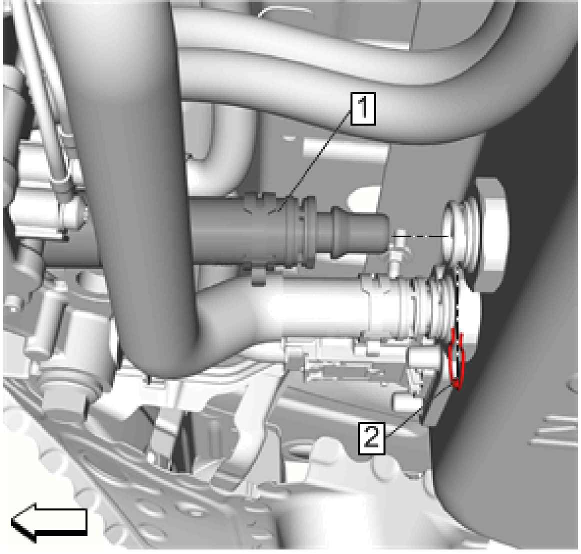

Fig. 18: Drive Motor Battery Coolant Cooler Outlet Hose And Clip (1st Design Battery Pack)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When installing the inlet or outlet hose, be careful not to confuse the inlet port and outlet port.**

1. If equipped with the 1st design of battery pack having female inlet and female outlet port, install the clip (2) and the drive motor battery coolant cooler outlet hose (1) to the RESS.

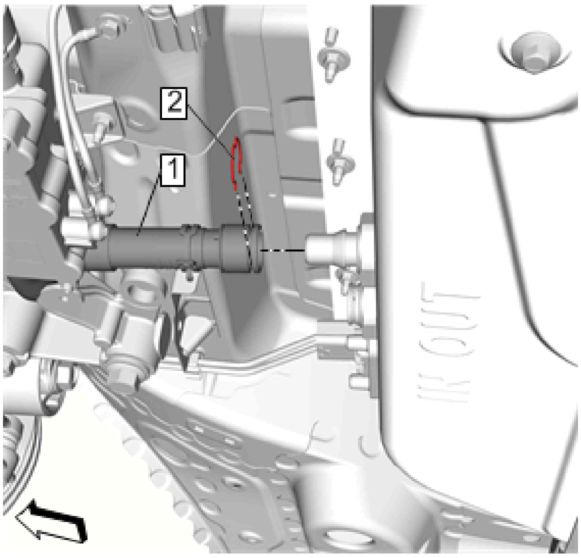

Fig. 19: Drive Motor Battery Coolant Cooler Outlet Hose And Clip (2nd Design Battery Pack)
Courtesy of GENERAL MOTORS COMPANY

2. If equipped with the 2nd design of battery pack having female inlet and male outlet port, install the clip (2) and the drive motor battery coolant cooler outlet hose (1) to the RESS.

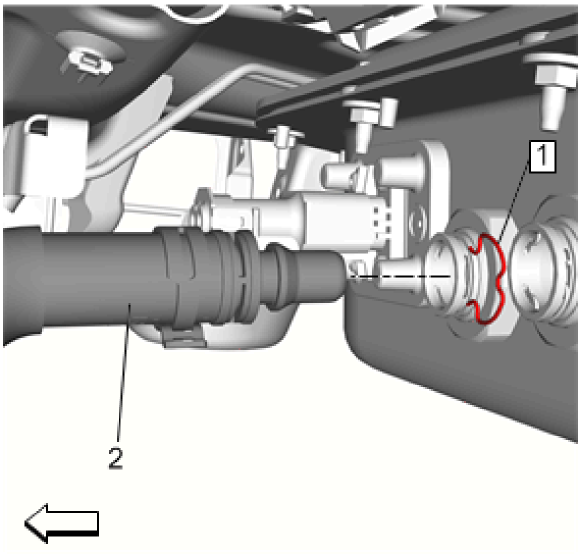

Fig. 20: Battery Vent Hose And Clip
Courtesy of GENERAL MOTORS COMPANY

3. Install Battery Vent Hose (2)
4. Install Clip (1)

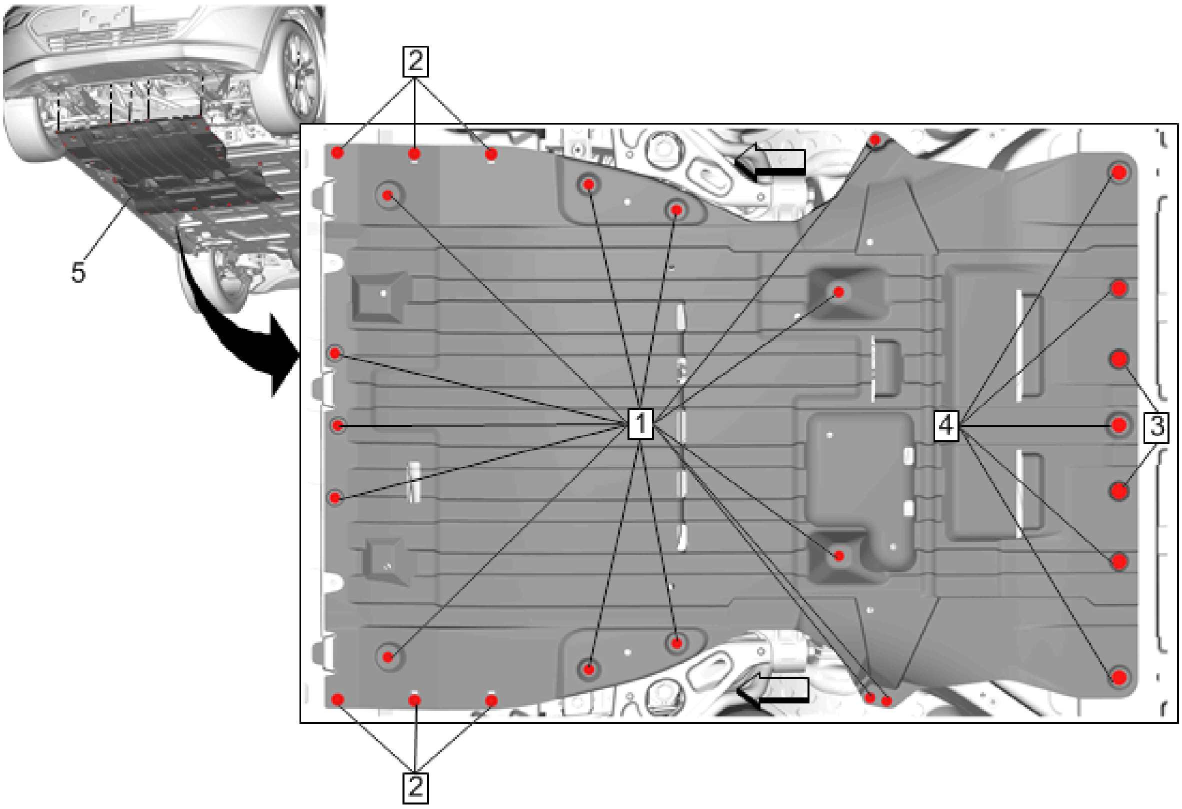

Fig. 21: Front Compartment Air Deflector And Fasteners
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Compartment Air Deflector (5). Refer to **Front Compartment Air Deflector Replacement**
6. Lower the vehicle. Refer to **Lifting and Jacking the Vehicle**
7. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

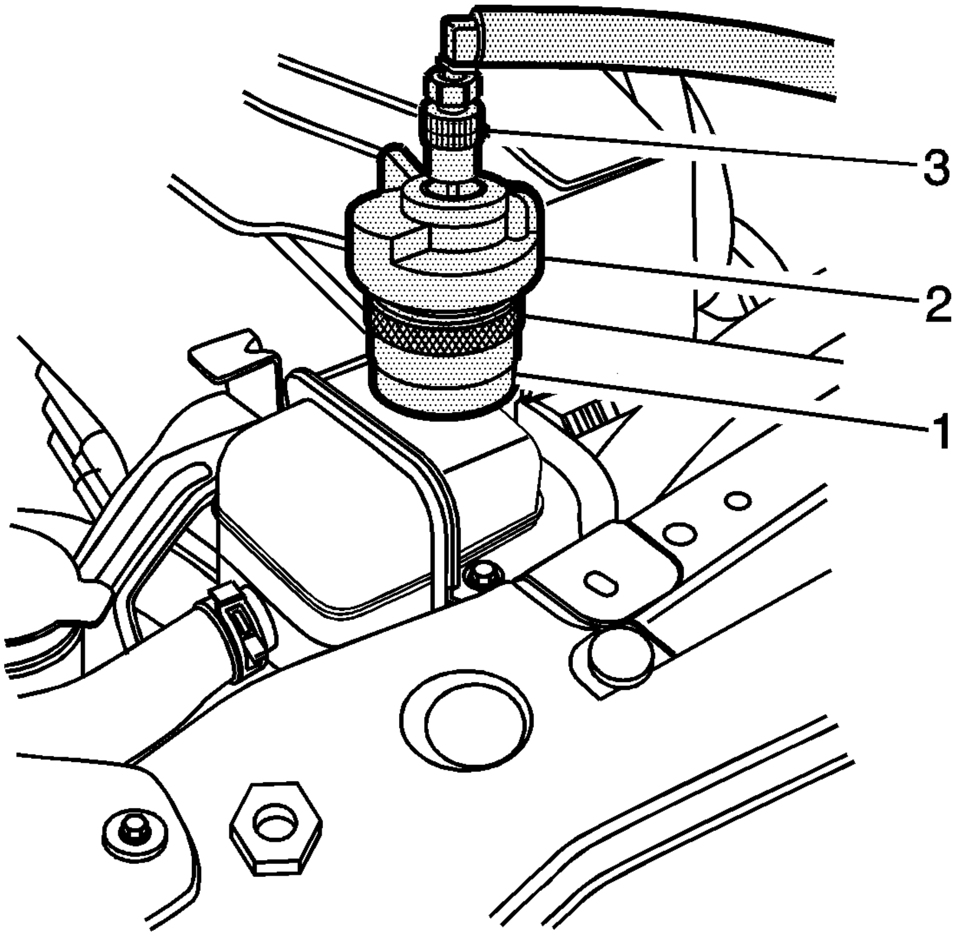

Fig. 22: Adapter, Vacuum Gauge Assembly And Vac-N-Fill Cap
Courtesy of GENERAL MOTORS COMPANY

NOTE: **To prevent boiling of the coolant/water mixture in the vehicles cooling system, do not apply vacuum to a cooling system above 49Â°C (120Â°F). The tool will not operate properly when the coolant is boiling.**

8. Install **GE-46143-2** adapter (1).
9. Attach the Vac-N-Fill cap (2) to **GE-46143-2** adapter (1).
10. Attach the vacuum gauge assembly (3) to the Vac-N-Fill cap (2).

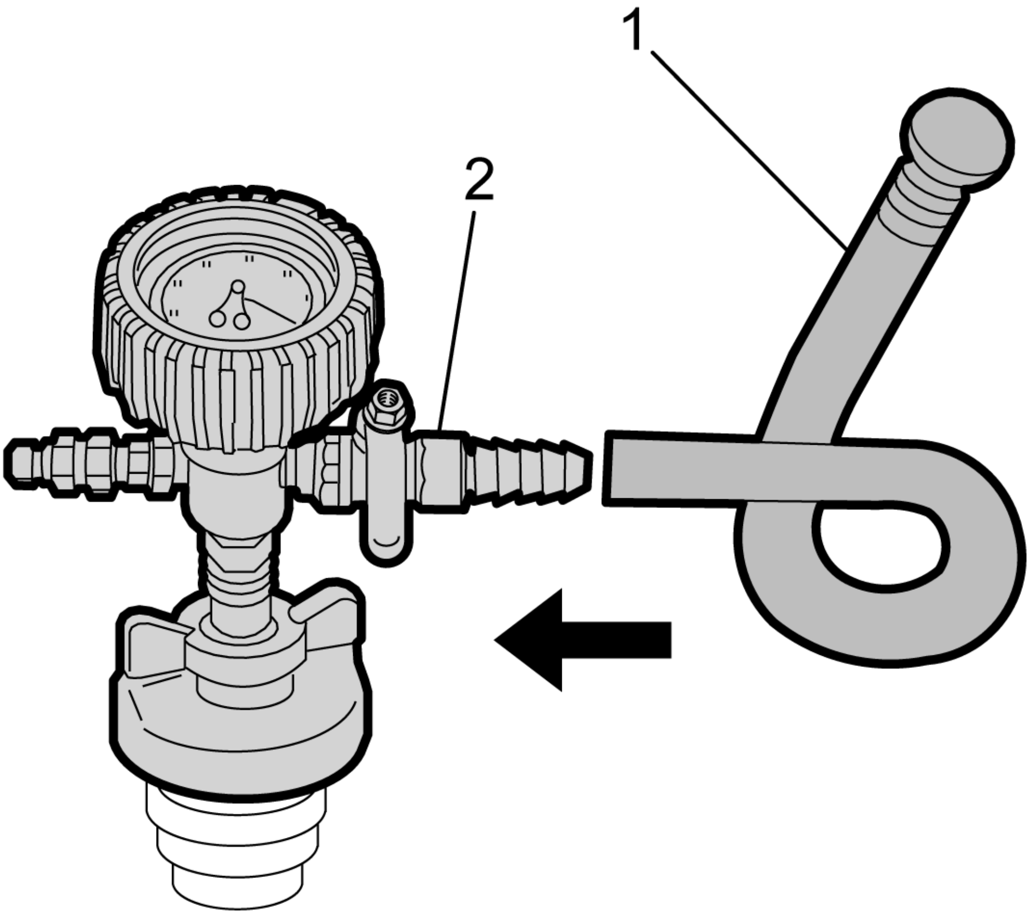

Fig. 23: Vacuum Gauge Assembly & Fill Hose
Courtesy of GENERAL MOTORS COMPANY

11. Attach the fill hose (1) to the barb fitting on the vacuum gauge assembly.

    Ensure that the valve is closed.

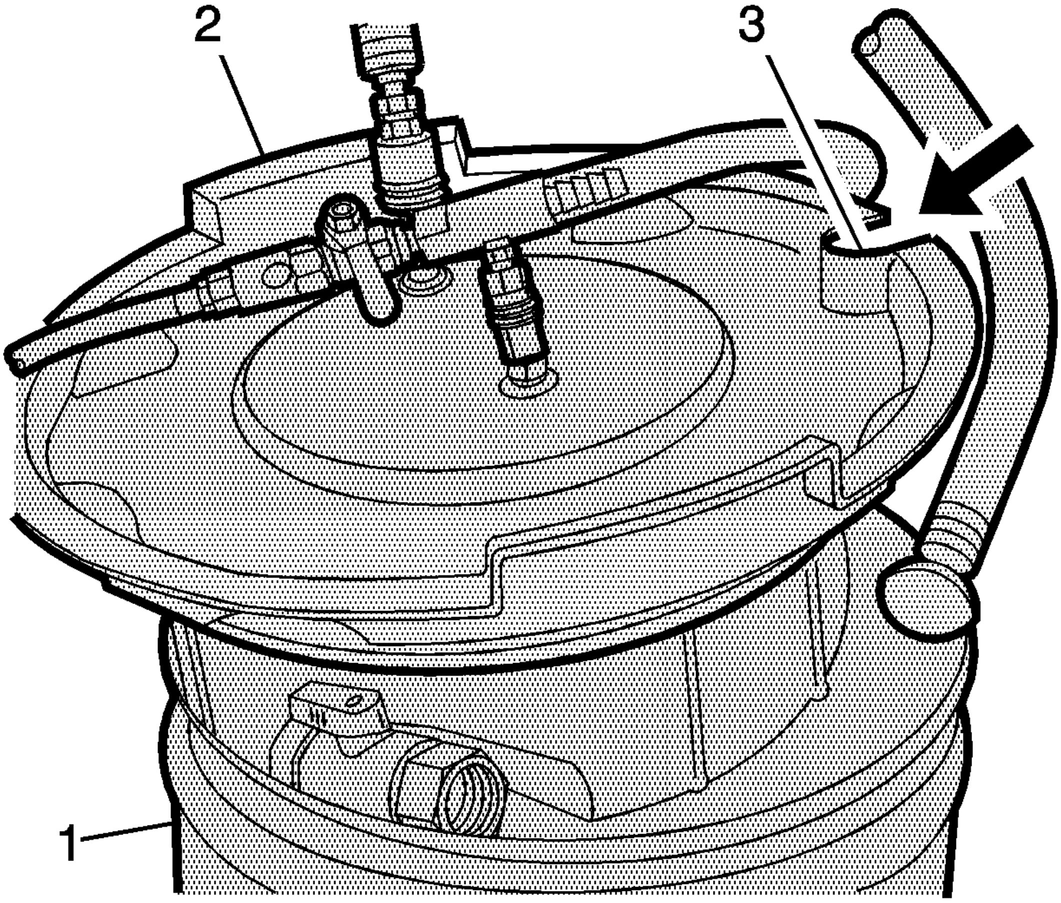

Fig. 24: Graduated Reservoir, Vacuum Tank & Cut-Out Area
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a Pre-mixed DEXCOOLÂ® (50/50 mixture of DEXCOOLÂ® and deionized water). Always use more coolant than necessary. This will eliminate air from being drawn into the cooling system.

12. Pour the coolant mixture into the graduated reservoir (1).
13. Place the fill hose in the graduated reservoir (1).

NOTE: Prior to installing the vacuum tank onto the graduated reservoir, ensure that the drain valve located on the bottom of the tank is closed.

14. Install the vacuum tank (2) on the graduated reservoir with the fill hose routed through the cut-out area (3) in the vacuum tank.

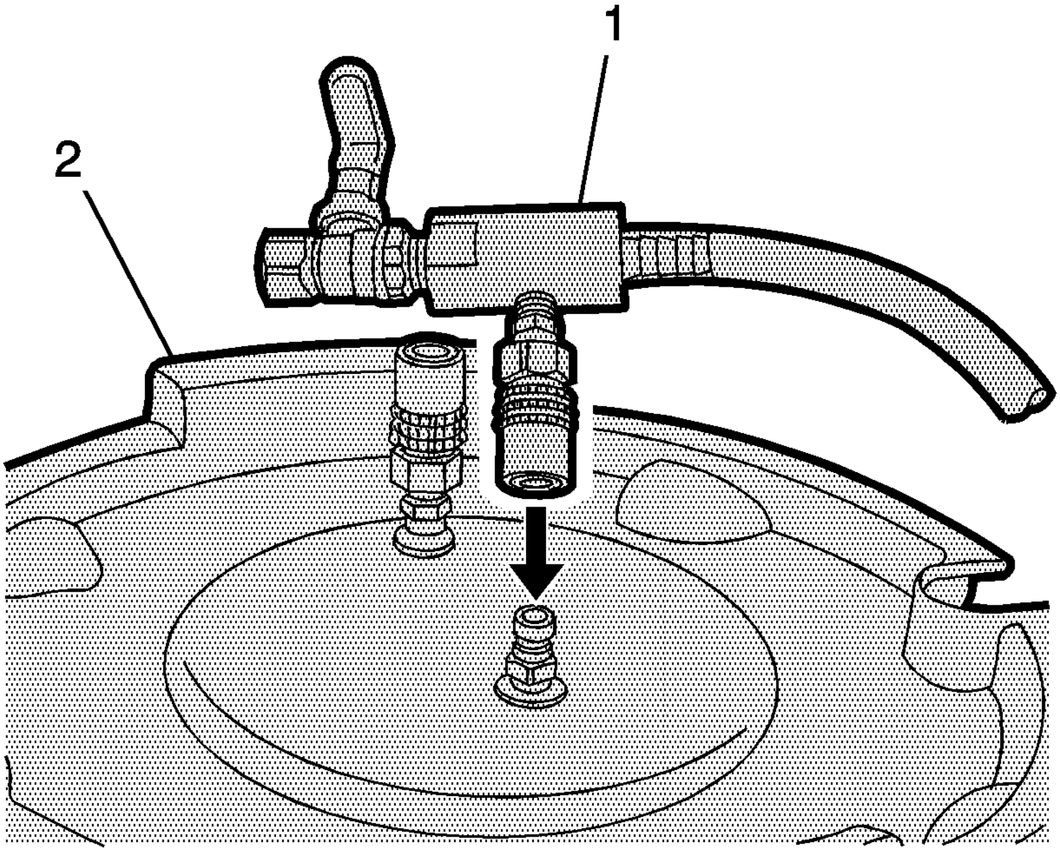

Fig. 25: Vacuum Tank & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

15. Attach the venturi assembly (1) to the vacuum tank (2).

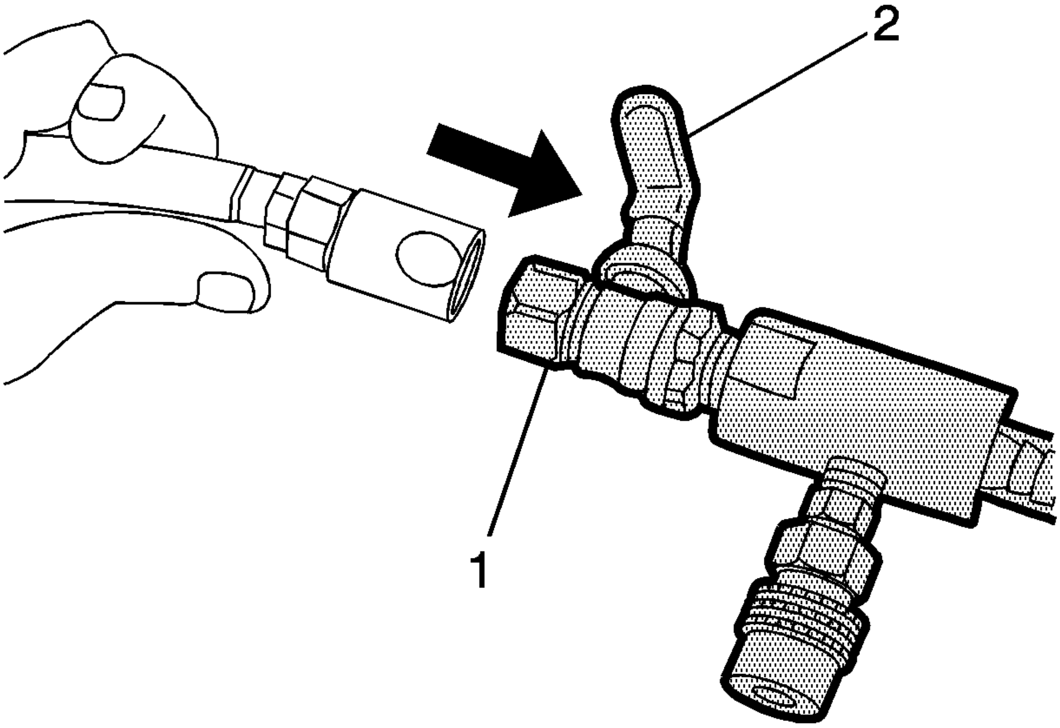

Fig. 26: Venturi Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

16. Attach a shop air hose to the venturi assembly (1).

    Ensure the valve (2) on the venturi assembly is closed.

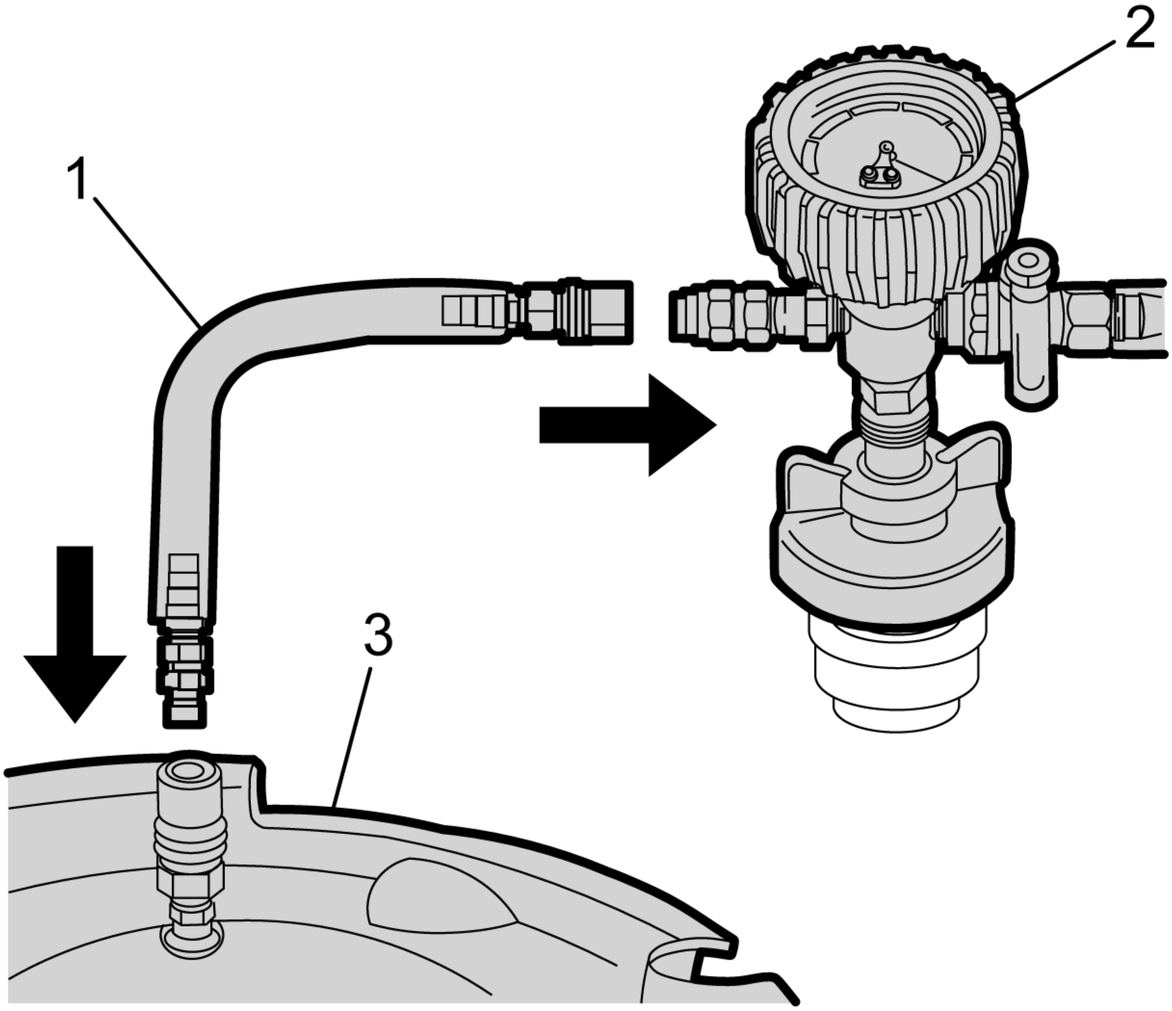

Fig. 27: Vacuum Hose, Gauge Assembly & Tank
Courtesy of GENERAL MOTORS COMPANY

17. Attach the vacuum hose (1) to the vacuum gauge assembly (2) and the vacuum tank (3).

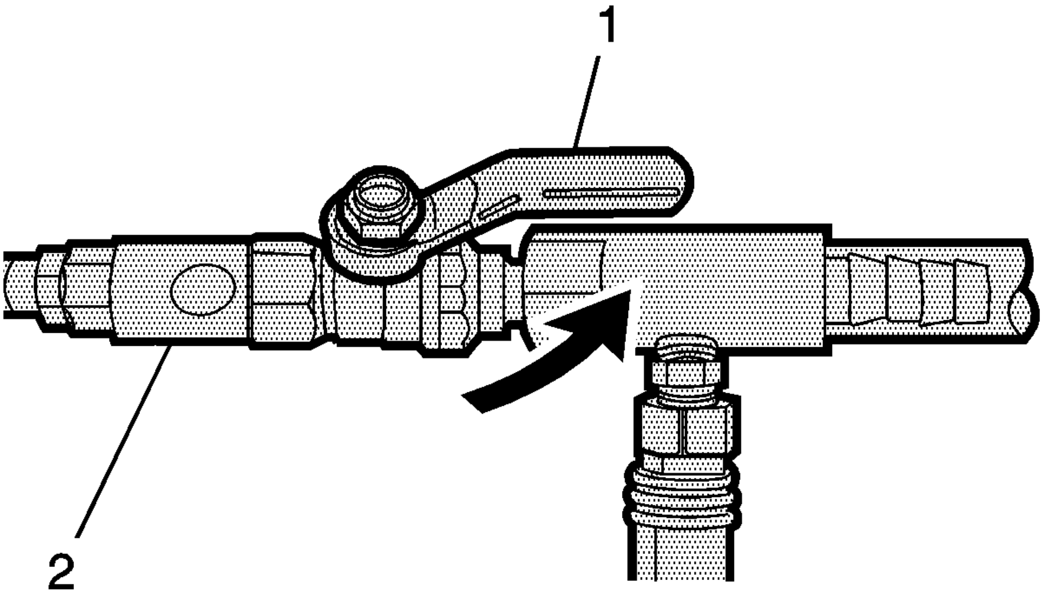

Fig. 28: Valve & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

18. Open the valve (1) on the venturi assembly (2). The vacuum gauge will begin to rise and a hissing noise will be present.

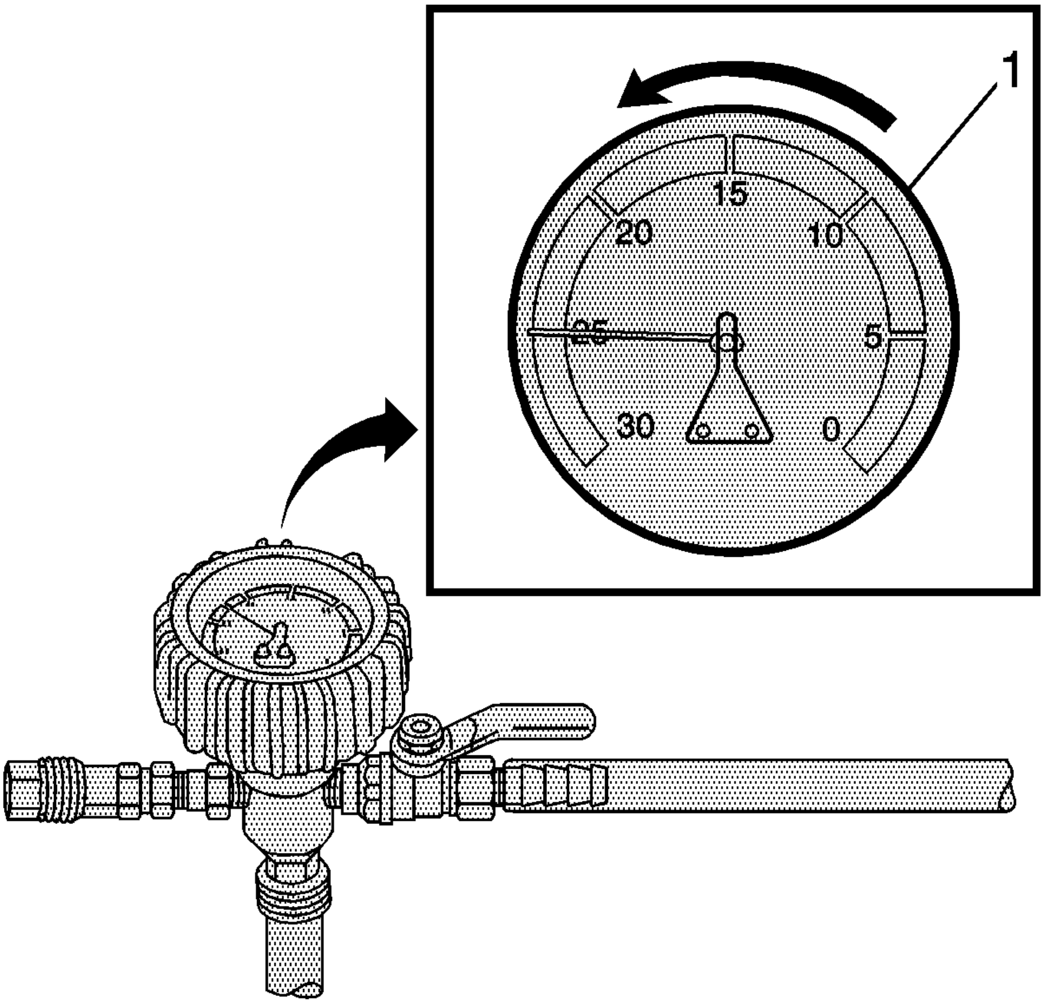

Fig. 29: Vacuum Gauge Needle
Courtesy of GENERAL MOTORS COMPANY

19. Continue to draw vacuum until the needle stops rising (1). This should be 610 - 660 mm Hg (24 - 26 in Hg).

    Cooling hoses may start to collapse. This is normal due to vacuum draw.

20. To aid in the fill process, position the graduated reservoir above the coolant fill port.

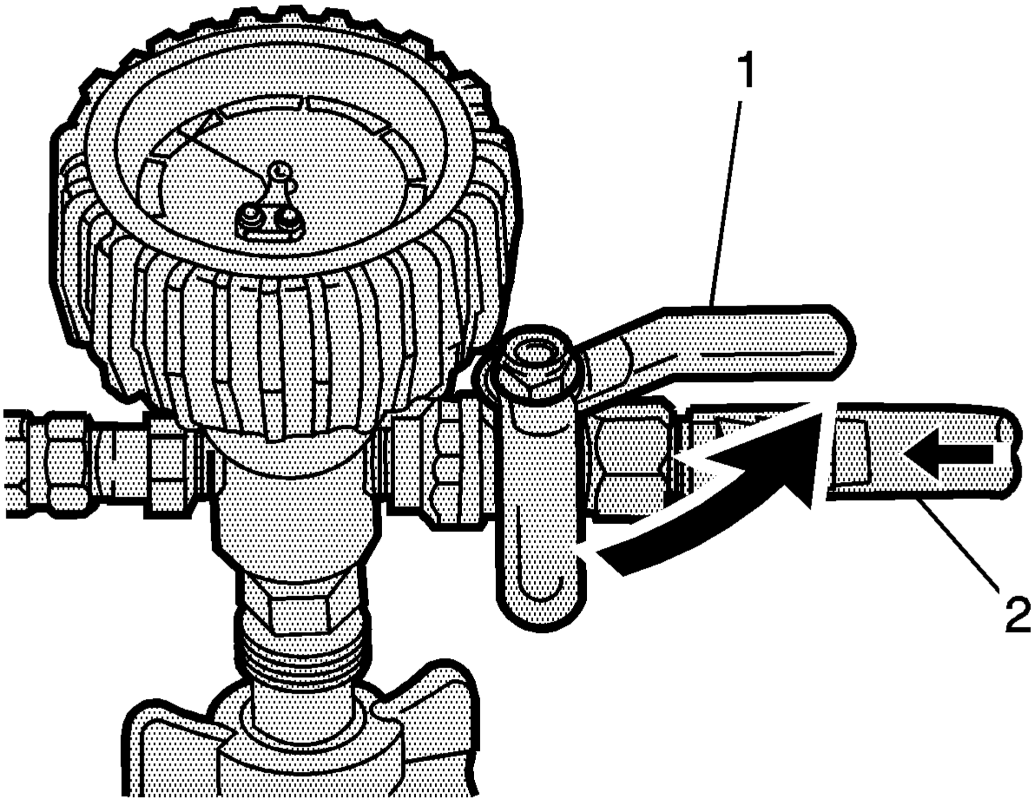

Fig. 30: Vacuum Gauge Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

21. Slowly open the valve (1) on the vacuum gauge assembly (2). When the coolant reaches the top of the fill hose, close the valve. This will eliminate air from the fill hose.
22. Close the valve on the venturi assembly.
23. If there is a suspected leak in the cooling system, allow the system to stabilize under vacuum and monitor for vacuum loss.

    If vacuum loss is observed, refer to **Hybrid Cooling System Loss of Coolant (Drive Motor Battery Cooling System)Hybrid Cooling System Loss of Coolant (Drive Motor Generator Power Inverter Module Cooling System)**.

24. Open the valve on the vacuum gauge assembly. The vacuum gauge will drop as coolant is drawn into the system.

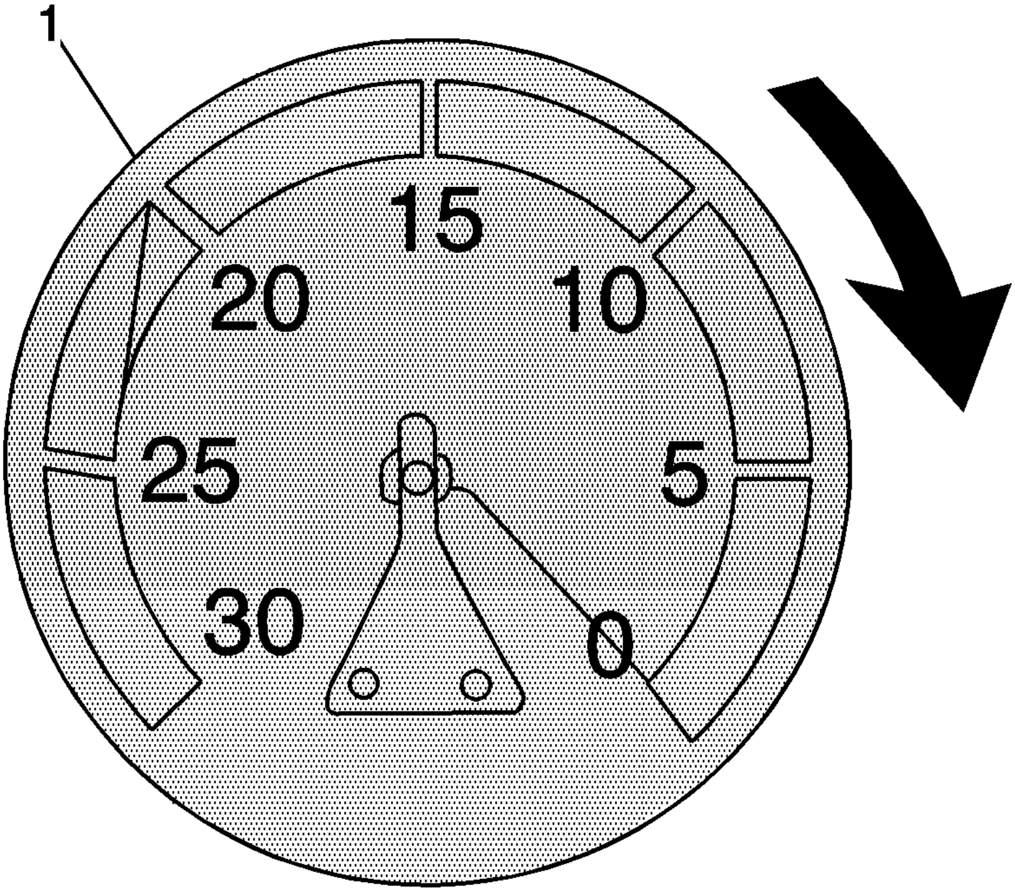

Fig. 31: Vacuum Gauge
Courtesy of GENERAL MOTORS COMPANY

25. Once the vacuum gauge (1) reaches zero, close the valve on the vacuum gauge assembly and repeat steps 15 - 21.
26. Ensure that the vehicle is in service mode. Refer to **Power Mode Description and Operation**
27. With the GDS scan tool, activate the hybrid/EV battery pack coolant pump for 5 minutes while maintaining 381 mm (15 in Hg) vacuum throughout the process.
28. Detach the Vac-N-Fill cap from the **GE-46143-2** adapter.
29. Remove **GE-46143-2** adapter from the surge tank fill neck.

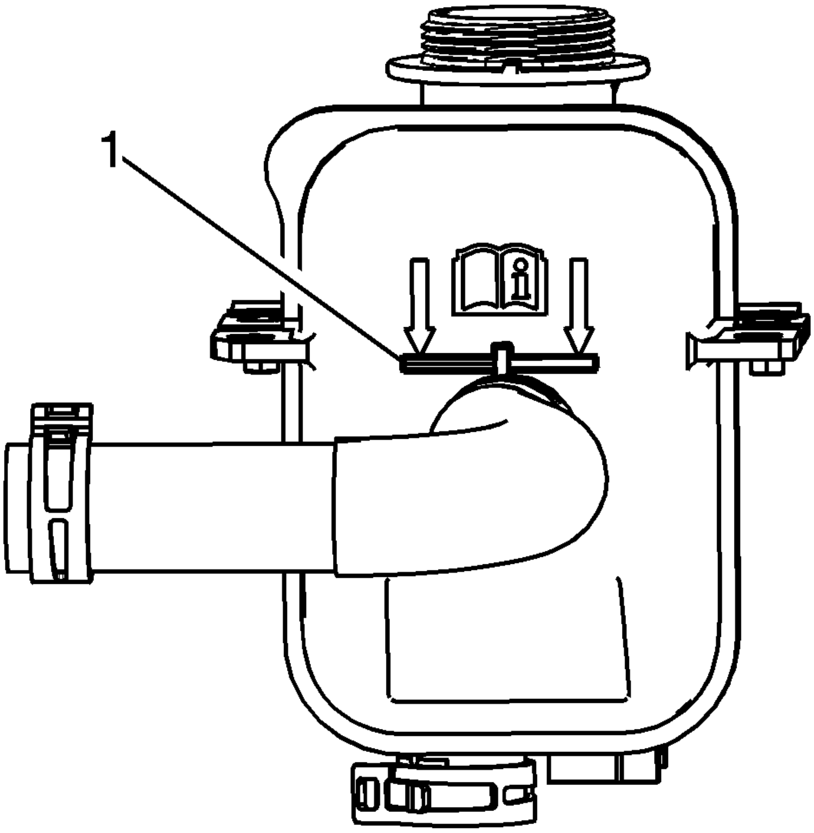

Fig. 32: Adjusting Surge Tank Coolant Level To Position Just Above Seam
Courtesy of GENERAL MOTORS COMPANY

30. Upon completion of the hybrid/EV battery pack coolant pump bleed procedure, adjust the surge tank coolant level to a position just above the seam (1).
31. Inspect the concentration of the coolant mixture using **GE-26568** tester.

REMOVING EXCESS COOLANT FROM SYSTEM

NOTE: **After filling the cooling system, the extraction hose can be used to remove excess coolant to achieve the proper coolant level.**

1. Detach the vacuum hose from the vacuum gauge assembly.

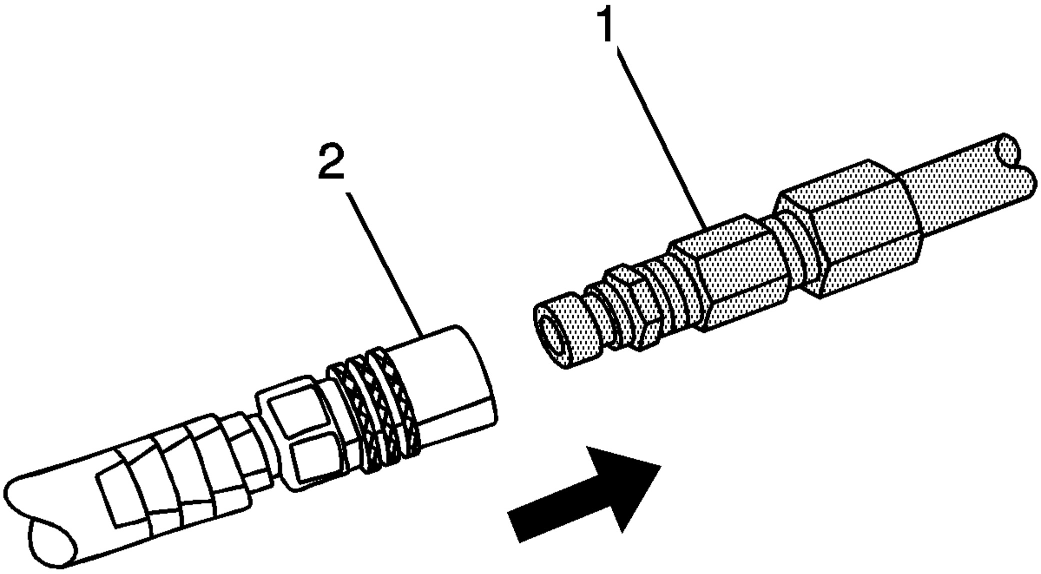

Fig. 33: Vacuum Hose & Extraction Hose
Courtesy of GENERAL MOTORS COMPANY

2. Attach the extraction hose (1) to the vacuum hose (2).

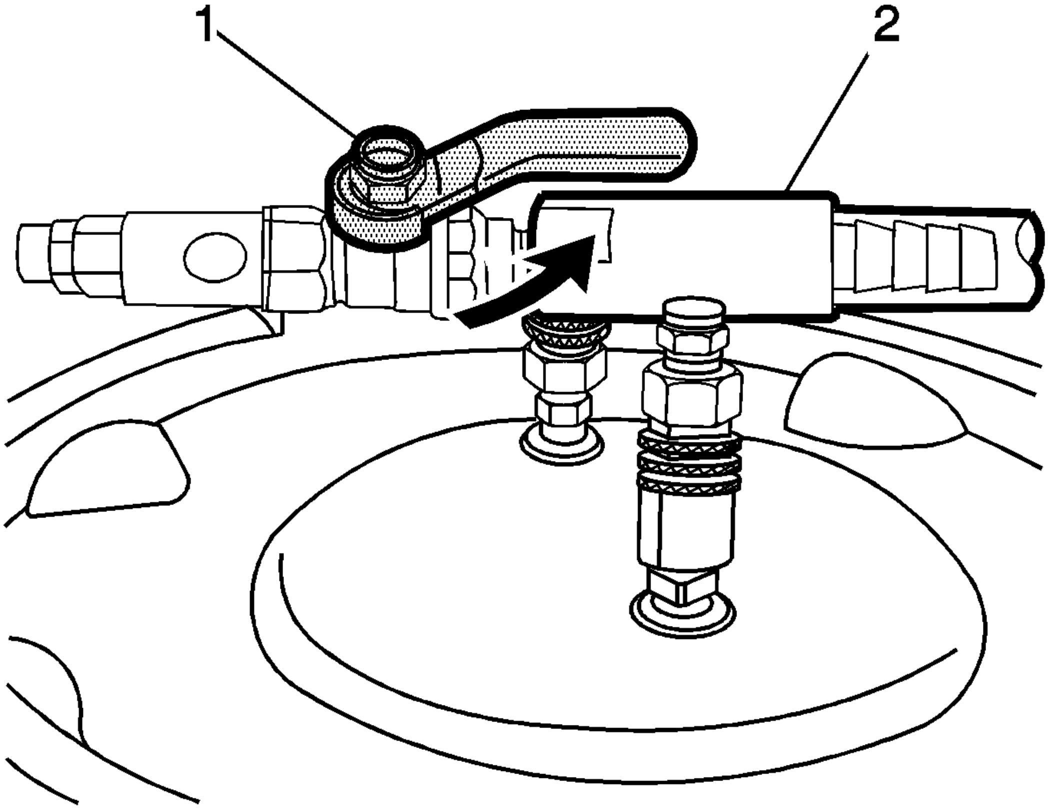

Fig. 34: Venturi Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

3. Open the valve (1) on the venturi assembly (2) to start a vacuum draw.

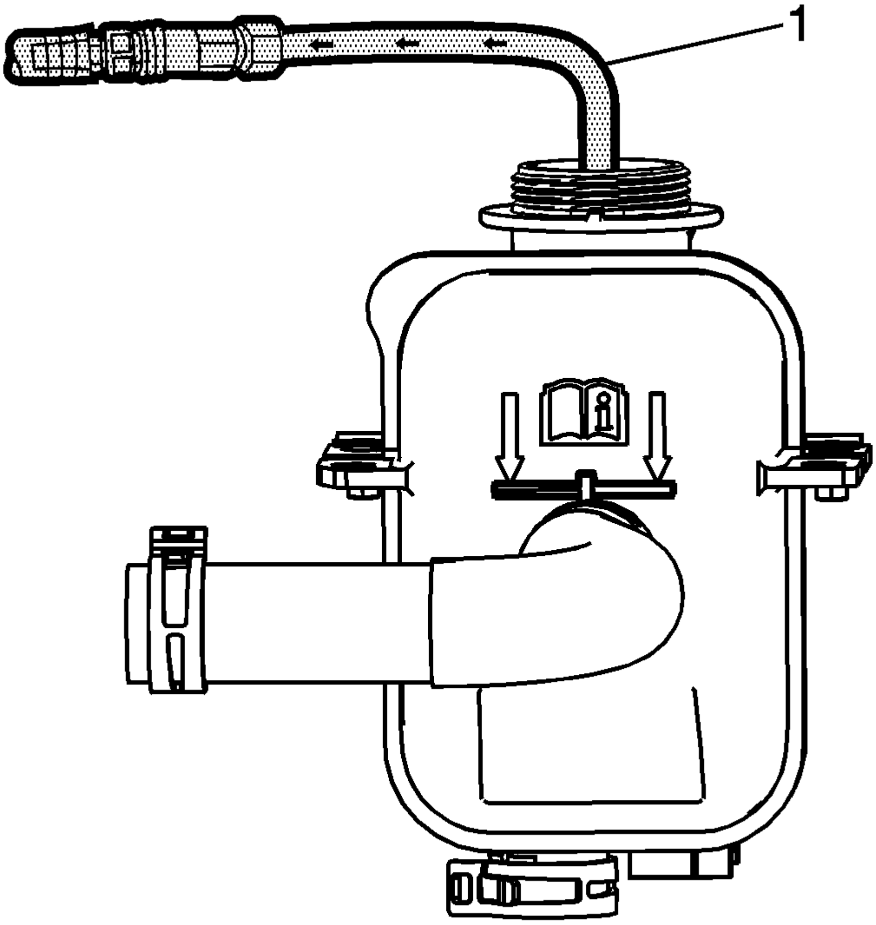

Fig. 35: Extraction Hose
Courtesy of GENERAL MOTORS COMPANY

4. Assemble the extraction hose (1) and insert into the surge tank.

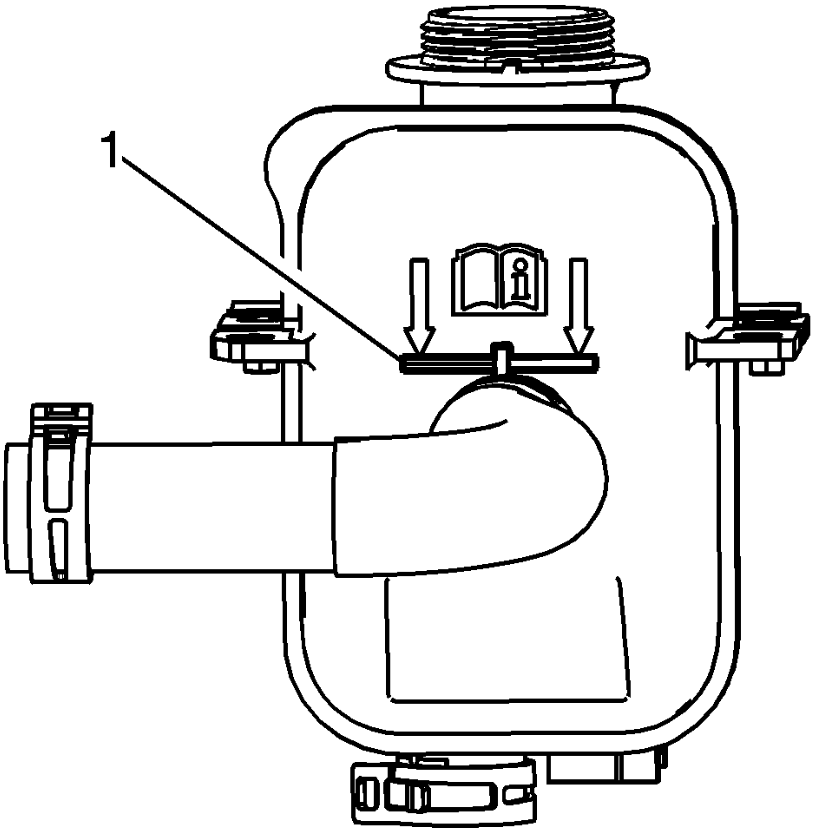

Fig. 36: Adjusting Surge Tank Coolant Level To Position Just Above Seam
Courtesy of GENERAL MOTORS COMPANY

5. Adjust the surge tank coolant level to a position just above the seam (1).
6. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

DRIVE MOTOR GENERATOR POWER INVERTER MODULE COOLING SYSTEM DRAINING AND FILLING

Special Tools

- **GE-26568** Coolant and Battery Tester
- **GE-46143 - 2** Cooling System Adapter
- **GE-47716** Vac-N-Fill Coolant Refill Tool

For equivalent regional tools, refer to Special Tools.

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

WARNING: **Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.**

WARNING: **To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.**

Draining Procedure

1. Turn Vehicle Power Off and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Remove the radiator surge tank cap.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
4. Place a drain pan under the vehicle.
5. Remove Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**

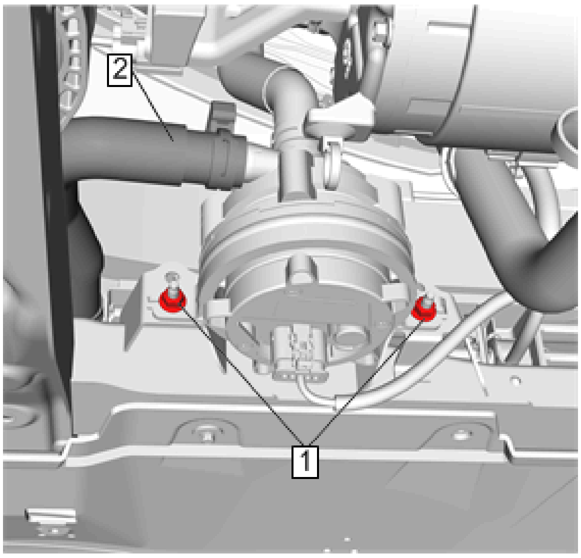

Fig. 37: Drive Motor Battery Coolant Pump Bracket Nuts And Drive Motor Generator Control Module Radiator Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

6. Remove Drive Motor Battery Coolant Pump Bracket Nuts (1) (Qty: 2)
7. Lower the drive motor battery coolant pump to secure the space to drain the coolant.
8. To drain the coolant, remove the drive motor generator control module radiator inlet hose (2) from the drive motor generator control module coolant pump. Refer to **Drive Motor Generator Control Module Radiator Inlet Hose Replacement (Pump To Radiator)**

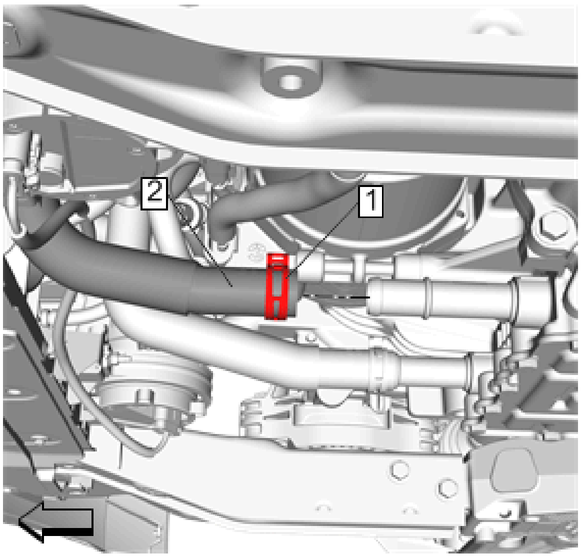

Fig. 38: Generator Control Module Coolant Tank Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

9. To drain the coolant, remove the generator control module coolant tank hose (2) from the drive motor. Refer to **Generator Control Module Coolant Tank Hose Replacement (DU To Surge Tank)**
10. Inspect the coolant.

Vac-N-Fill Procedure

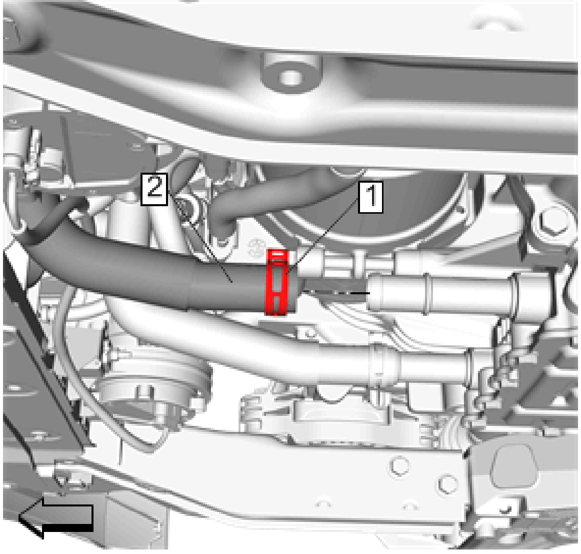

Fig. 39: Generator Control Module Coolant Tank Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install the generator control module coolant tank hose (2) to the drive motor. Refer to **Generator Control Module Coolant Tank Hose Replacement (DU To Surge Tank)**

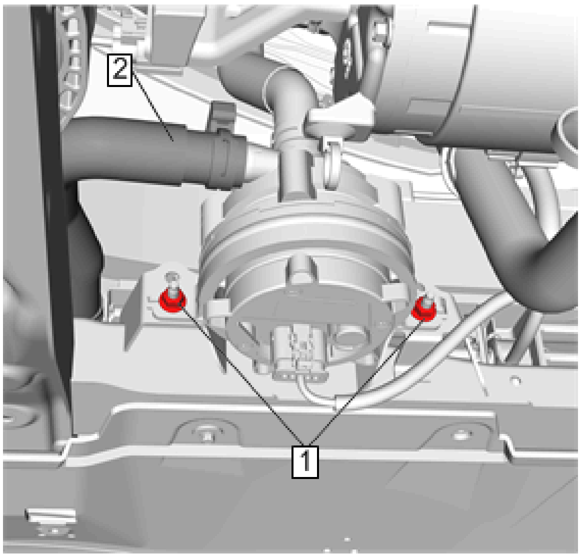

Fig. 40: Drive Motor Battery Coolant Pump Bracket Nuts And Drive Motor Generator Control Module Radiator Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution**

2. Install and tighten Drive Motor Battery Coolant Pump Bracket Nuts (1) (Qty: 2) to 9 N.m (80 lb in)
3. Install the drive motor generator control module radiator inlet hose (2) to the drive motor generator control module coolant pump. Refer to **Drive Motor Generator Control Module Radiator Inlet Hose Replacement (Pump To Radiator)**
4. Install Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
5. Turn Vehicle Power Off and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

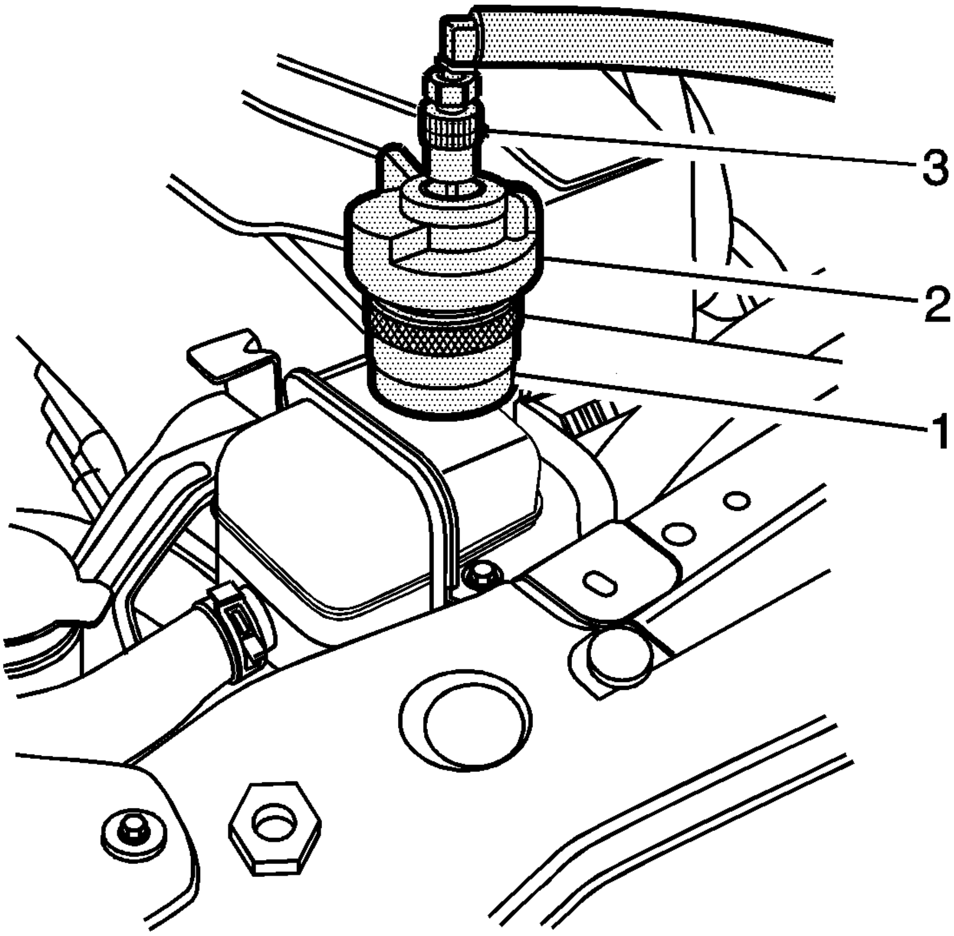

Fig. 41: Adapter, Vacuum Gauge Assembly And Vac-N-Fill Cap
Courtesy of GENERAL MOTORS COMPANY

NOTE: **To prevent boiling of the coolant/water mixture in the vehicles cooling system, do not apply vacuum to a cooling system above 49Â°C (120Â°F). The tool will not operate properly when the coolant is boiling.**

6. Install **GE-46143-2** adapter (1).
7. Attach the Van-N-Fill cap (2) to **GE-46143-2** adapter (1).
8. Attach the vacuum gauge assembly (3) to the Vac-N-Fill cap (2).

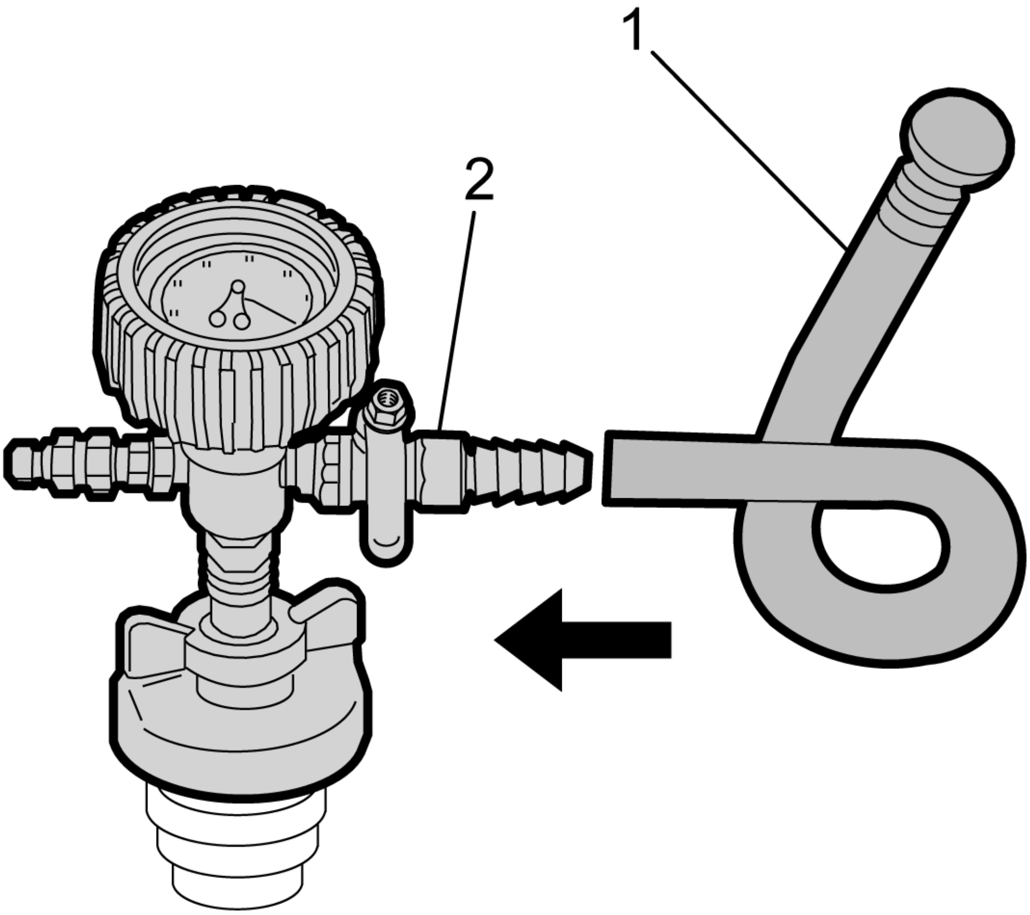

Fig. 42: Vacuum Gauge Assembly & Fill Hose
Courtesy of GENERAL MOTORS COMPANY

9. Attach the fill hose (1) to the barb fitting on the vacuum gauge assembly.

   Ensure that the valve is closed.

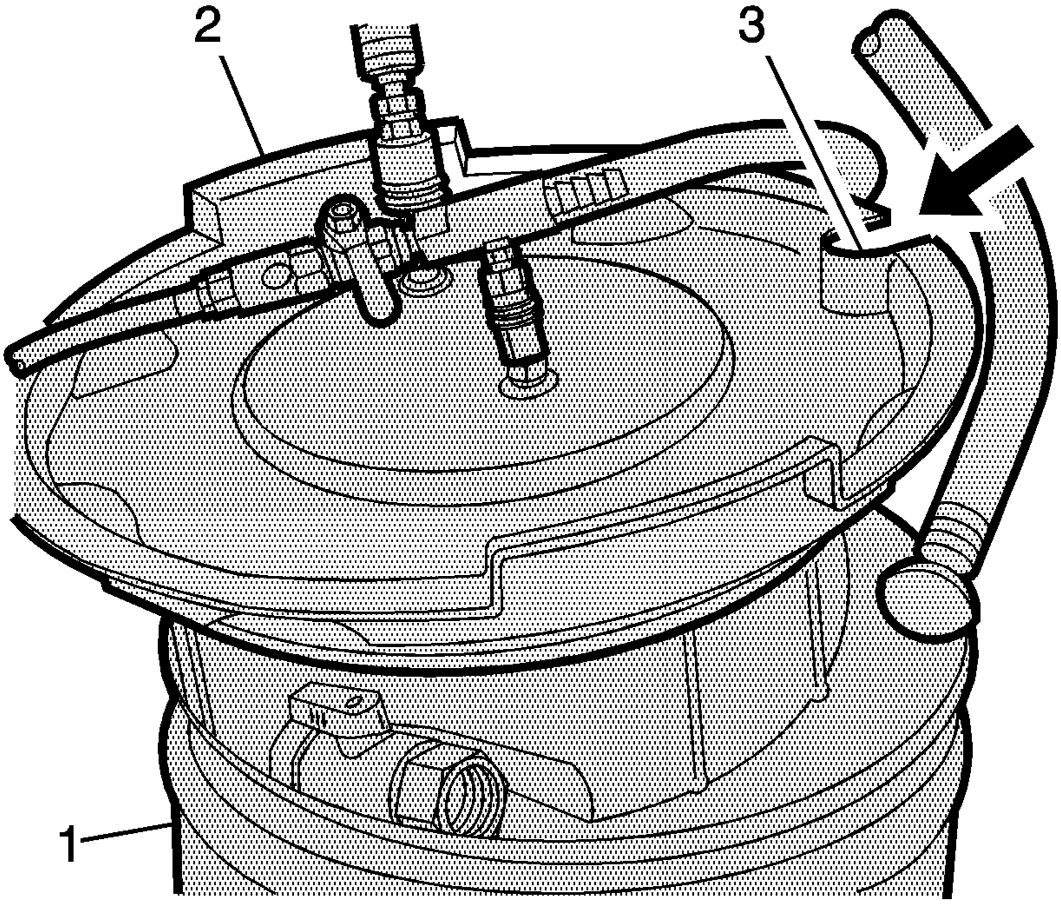

Fig. 43: Graduated Reservoir, Vacuum Tank & Cut-Out Area
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use a Pre-mixed DEXCOOLÂ® (50/50 mixture of DEXCOOLÂ® and deionized water). Always use more coolant than necessary. This will eliminate air from being drawn into the cooling system.**

10. Pour the coolant mixture into the graduated reservoir (1).
11. Place the fill hose in the graduated reservoir (1).

NOTE: **Prior to installing the vacuum tank onto the graduated reservoir, ensure that the drain valve located on the bottom of the tank is closed.**

12. Install the vacuum tank (2) on the graduated reservoir with the fill hose routed through the cut-out area (3) in the vacuum tank.

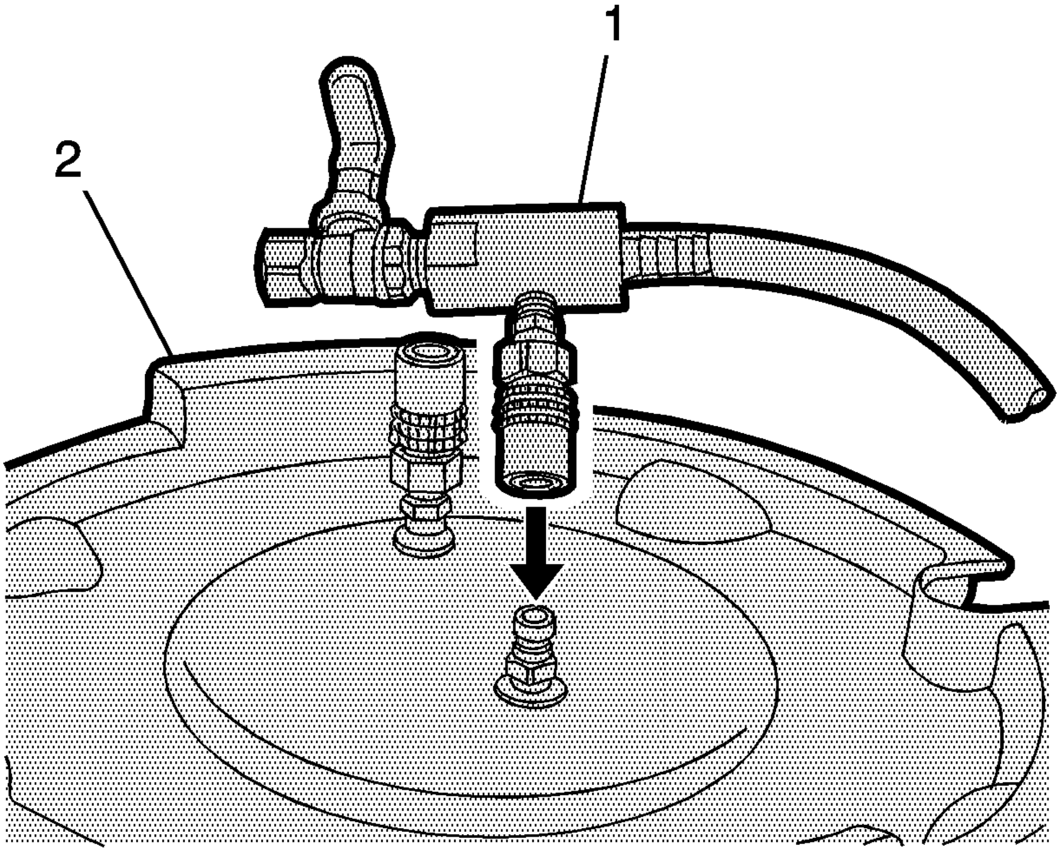

Fig. 44: Vacuum Tank & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

13. Attach the venturi assembly (1) to the vacuum tank (2).

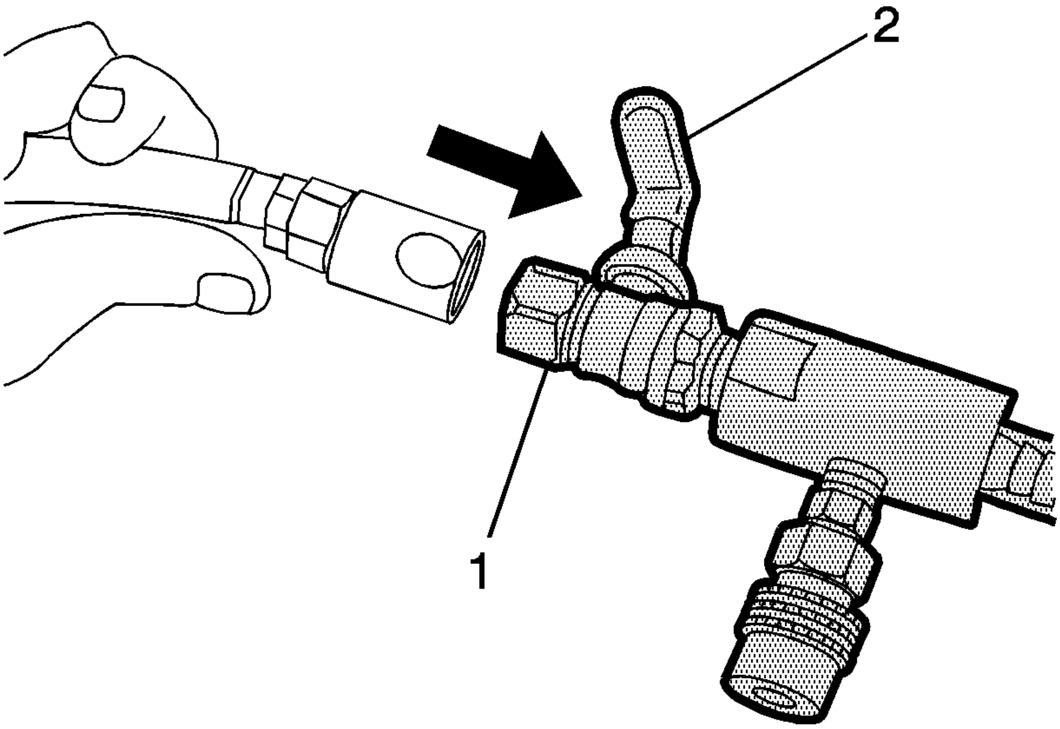

Fig. 45: Venturi Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

14. Attach a shop air hose to the venturi assembly (1).

    Ensure the valve (2) on the venturi assembly is closed.

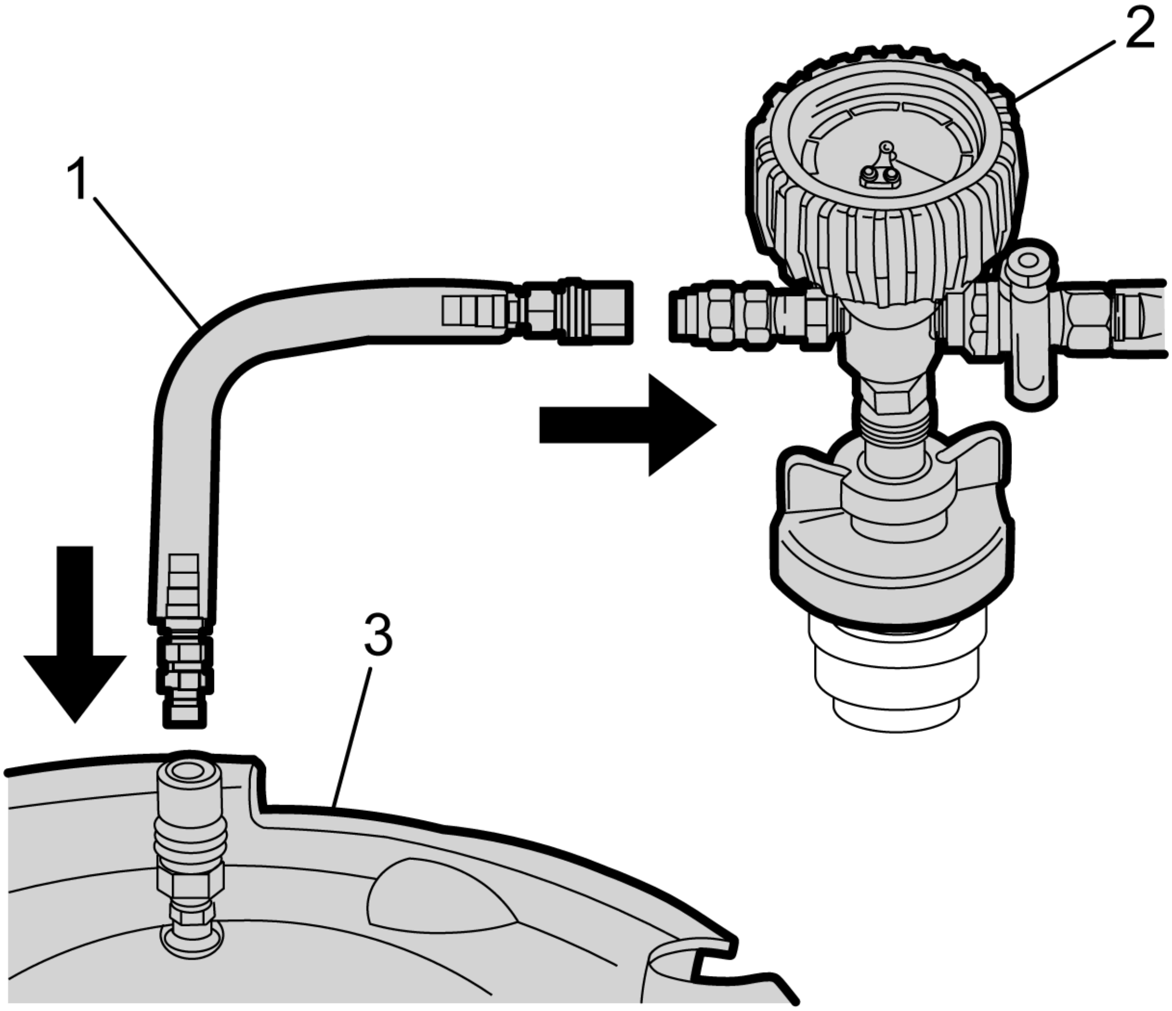

Fig. 46: Vacuum Hose, Gauge Assembly & Tank
Courtesy of GENERAL MOTORS COMPANY

15. Attach the vacuum hose (1) to the vacuum gauge assembly (2) and the vacuum tank (3).

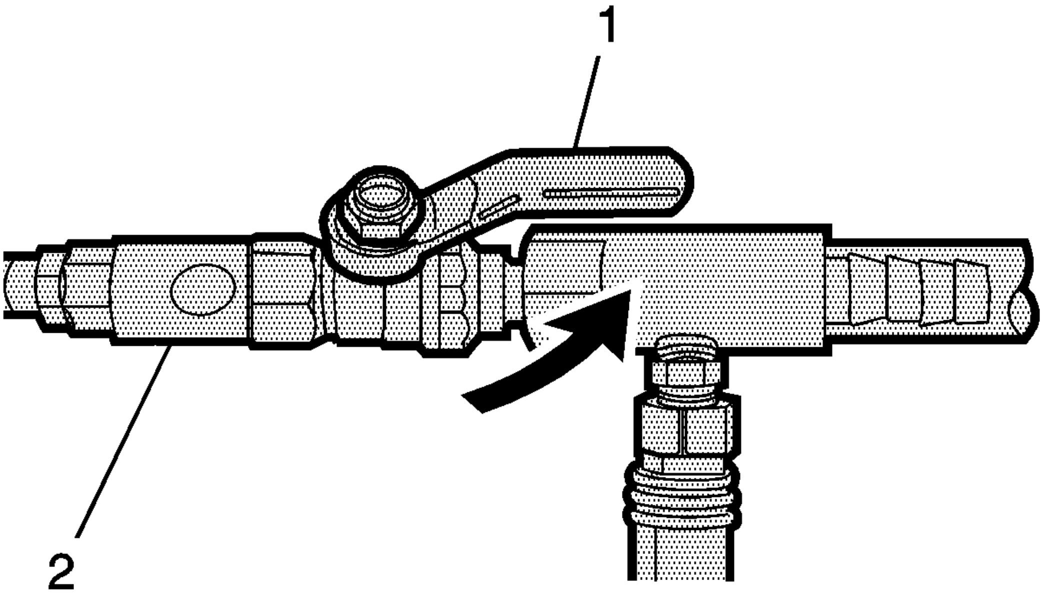

Fig. 47: Valve & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

16. Open the valve (1) on the venturi assembly (2). The vacuum gauge will begin to rise and a hissing noise will be present.

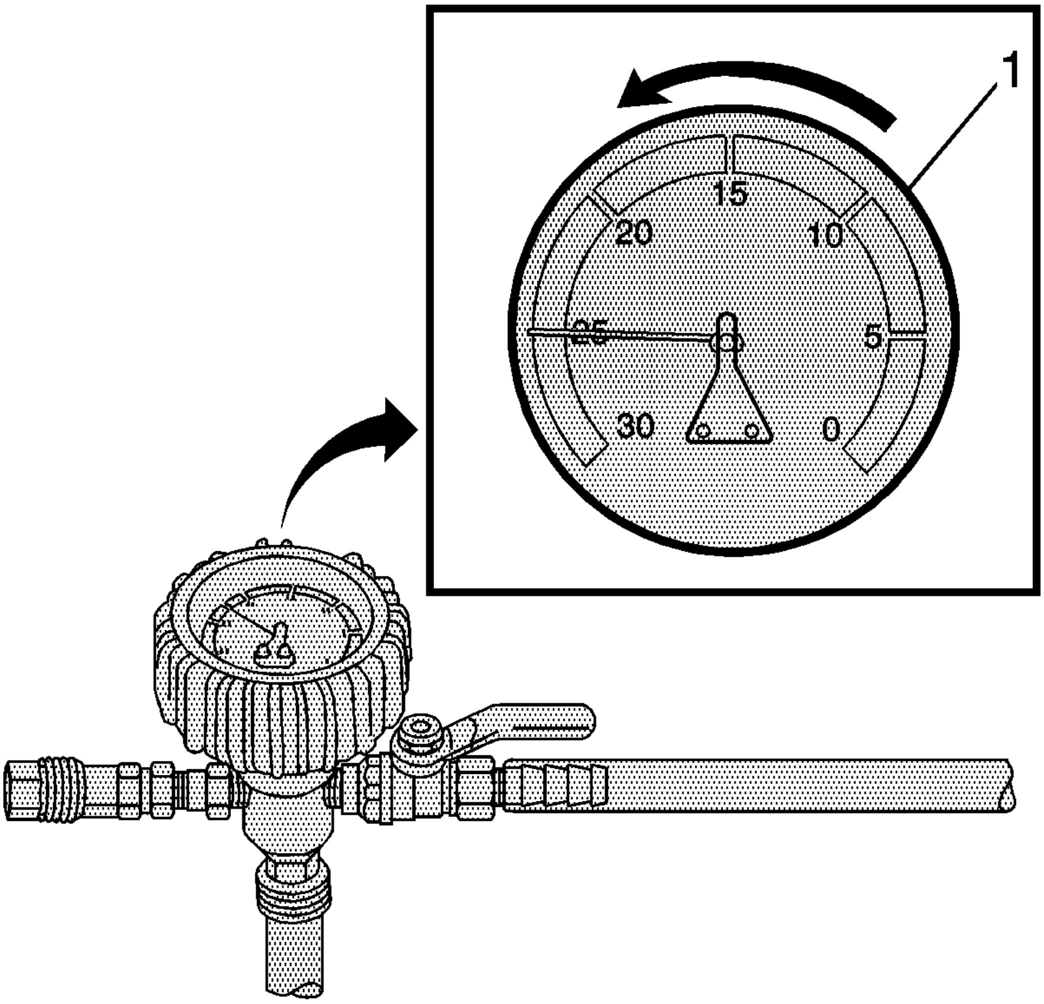

Fig. 48: Vacuum Gauge Needle
Courtesy of GENERAL MOTORS COMPANY

17. Continue to draw vacuum until the needle stops rising (1). This should be 610 - 660 mm Hg (24 - 26 in Hg).

    Cooling hoses may start to collapse. This is normal due to vacuum draw.

18. To aid in the fill process, position the graduated reservoir above the coolant fill port.

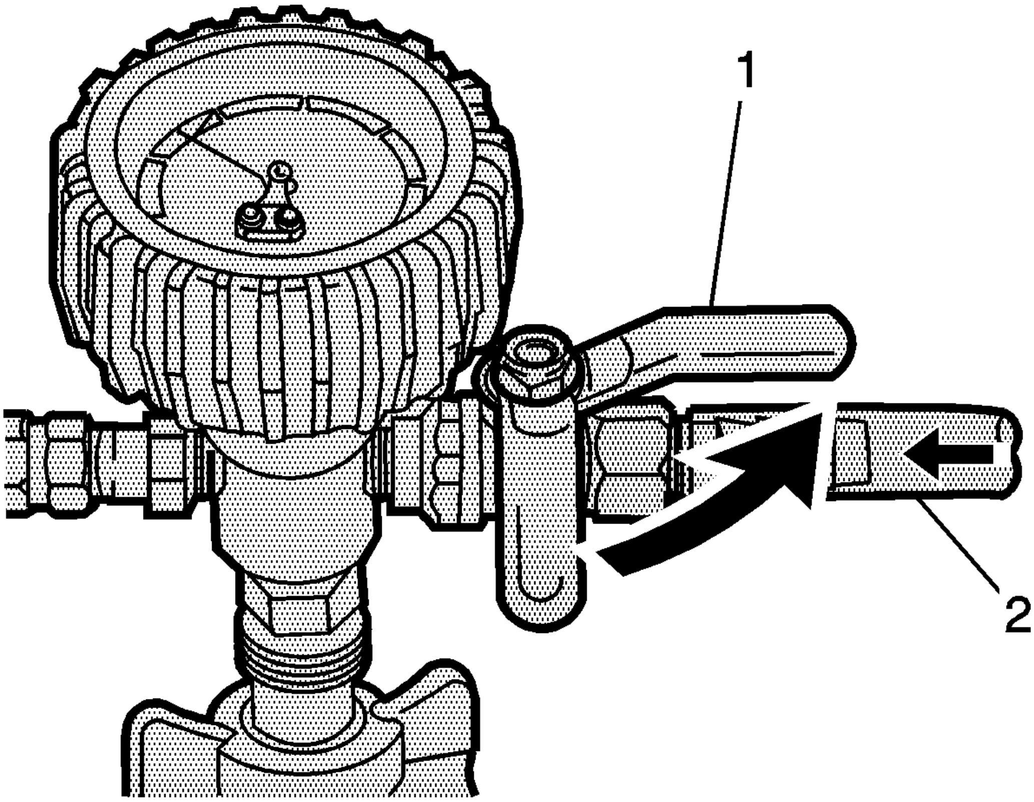

Fig. 49: Vacuum Gauge Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

19. Slowly open the valve (1) on the vacuum gauge assembly (2). When the coolant reaches the top of the fill hose, close the valve. This will eliminate air from the fill hose.
20. Close the valve on the venturi assembly.
21. If there is a suspected leak in the cooling system, allow the system to stabilize under vacuum and monitor for vacuum loss.

    If vacuum loss is observed, refer to **Hybrid Cooling System Loss of Coolant (Drive Motor Battery Cooling System)Hybrid Cooling System Loss of Coolant (Drive Motor Generator Power Inverter Module Cooling System)**.

22. Open the valve on the vacuum gauge assembly. The vacuum gauge will drop as coolant is drawn into the system.

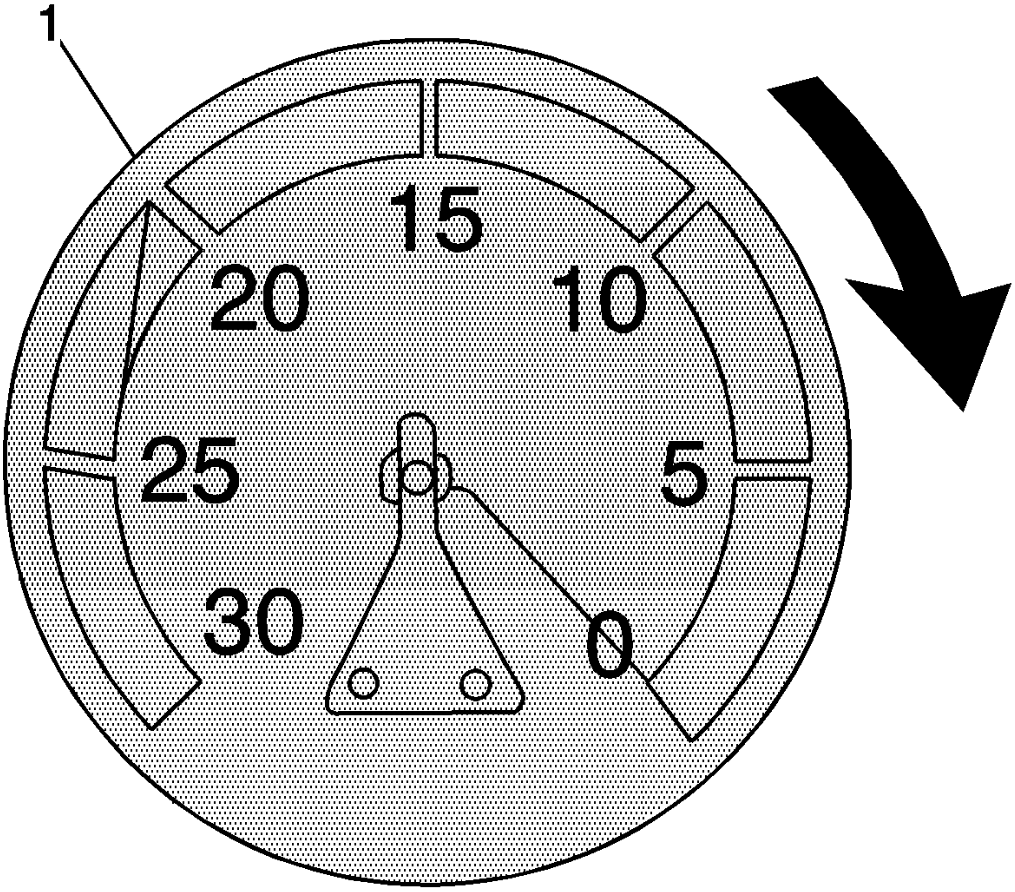

Fig. 50: Vacuum Gauge
Courtesy of GENERAL MOTORS COMPANY

23. Once the vacuum gauge (1) reaches zero, close the valve on the vacuum gauge assembly and repeat steps 15 - 21 one time.
24. Place vehicle in Service Mode. With the GDS scan tool, activate the drive motor generator control module coolant pump for 5 minutes while maintaining 381 mm (15 in Hg) vacuum throughout the process.
25. Detach the Vac-N-Fill cap from the **GE-46143-2** adapter.
26. Remove **GE-46143-2** adapter from the surge tank fill neck.

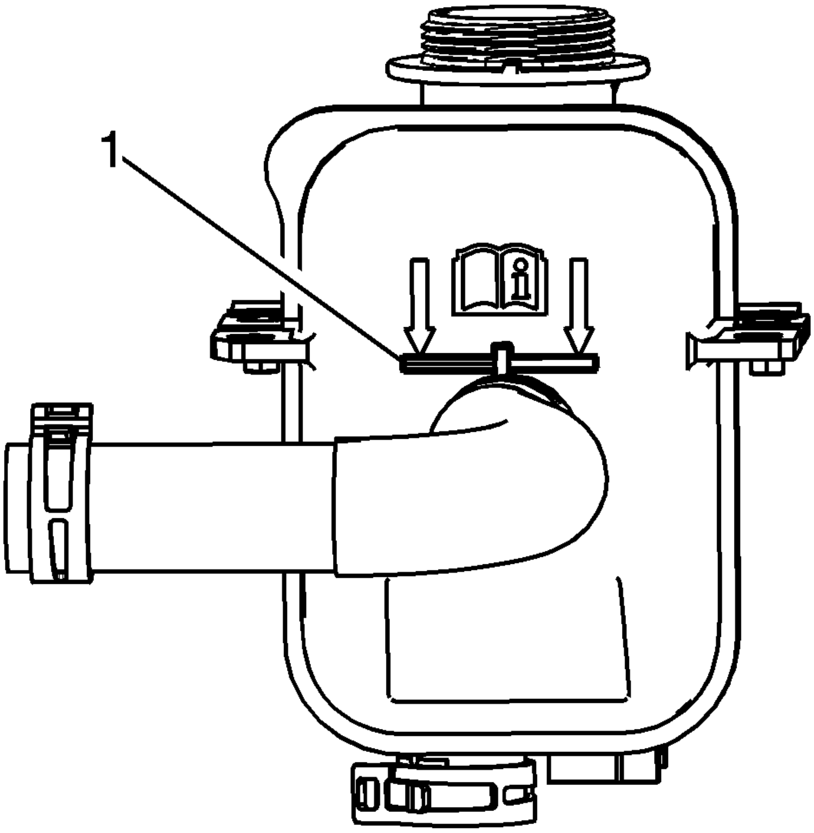

Fig. 51: Adjusting Surge Tank Coolant Level To Position Just Above Seam
Courtesy of GENERAL MOTORS COMPANY

27. Adjust the surge tank coolant level to a position just above the seam (1).
28. Inspect the concentration of the coolant mixture using **GE-26568** tester.

REMOVING EXCESS COOLANT FROM SYSTEM

NOTE: **After filling the cooling system, the extraction hose can be used to remove excess coolant to achieve the proper coolant level.**

1. Detach the vacuum hose from the vacuum gauge assembly.

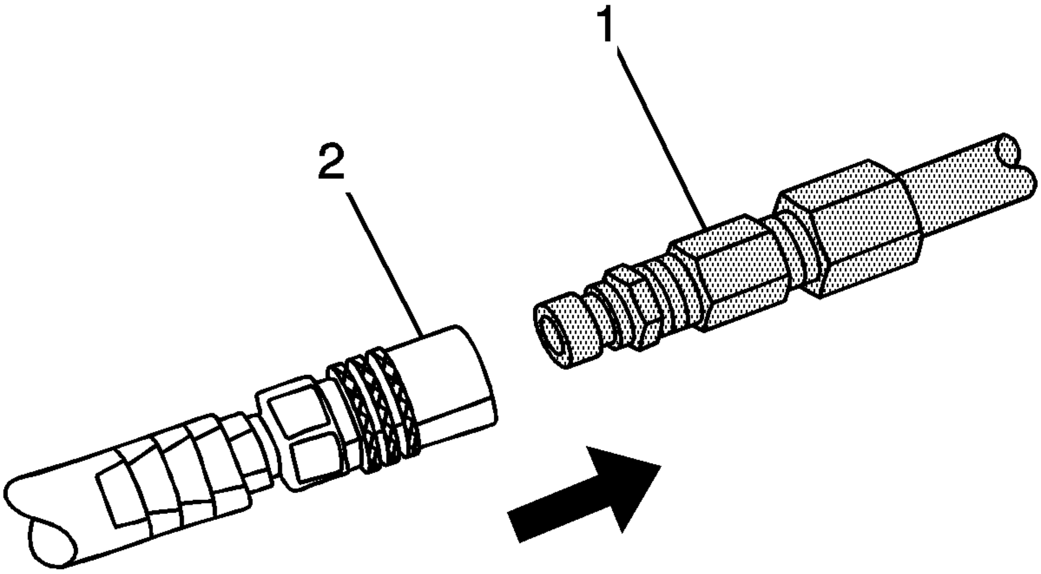

Fig. 52: Vacuum Hose & Extraction Hose
Courtesy of GENERAL MOTORS COMPANY

2. Attach the extraction hose (1) to the vacuum hose (2).

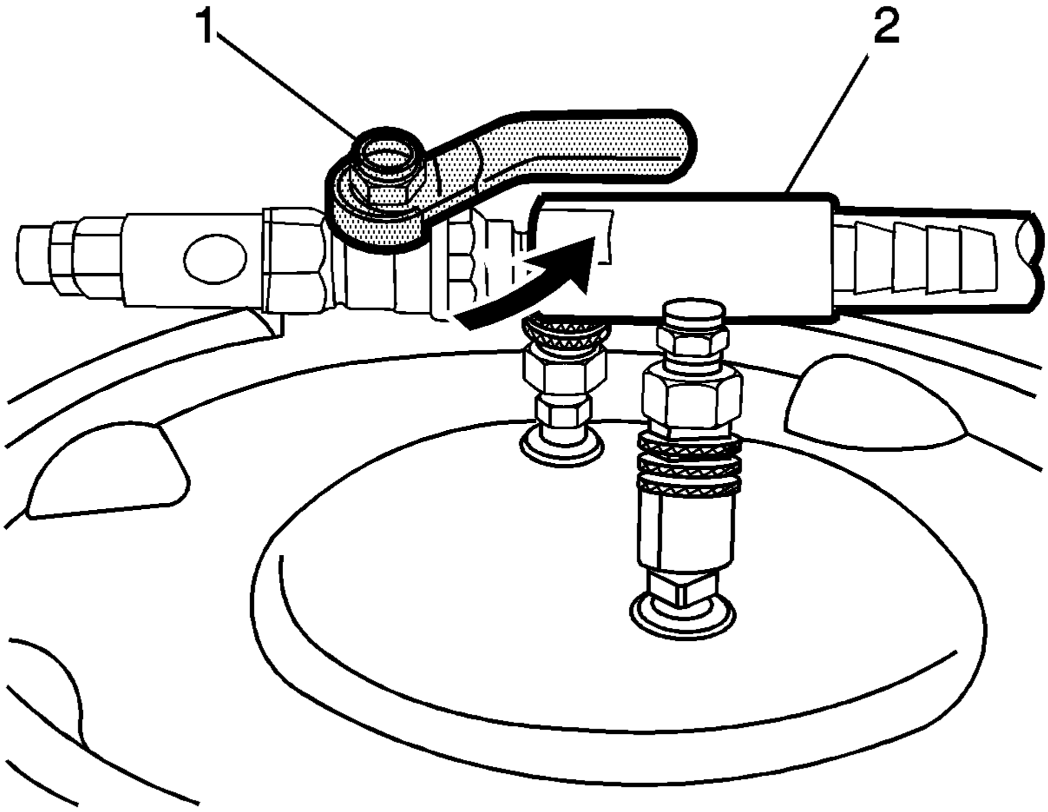

Fig. 53: Venturi Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

3. Open the valve (1) on the venturi assembly (2) to start a vacuum draw.

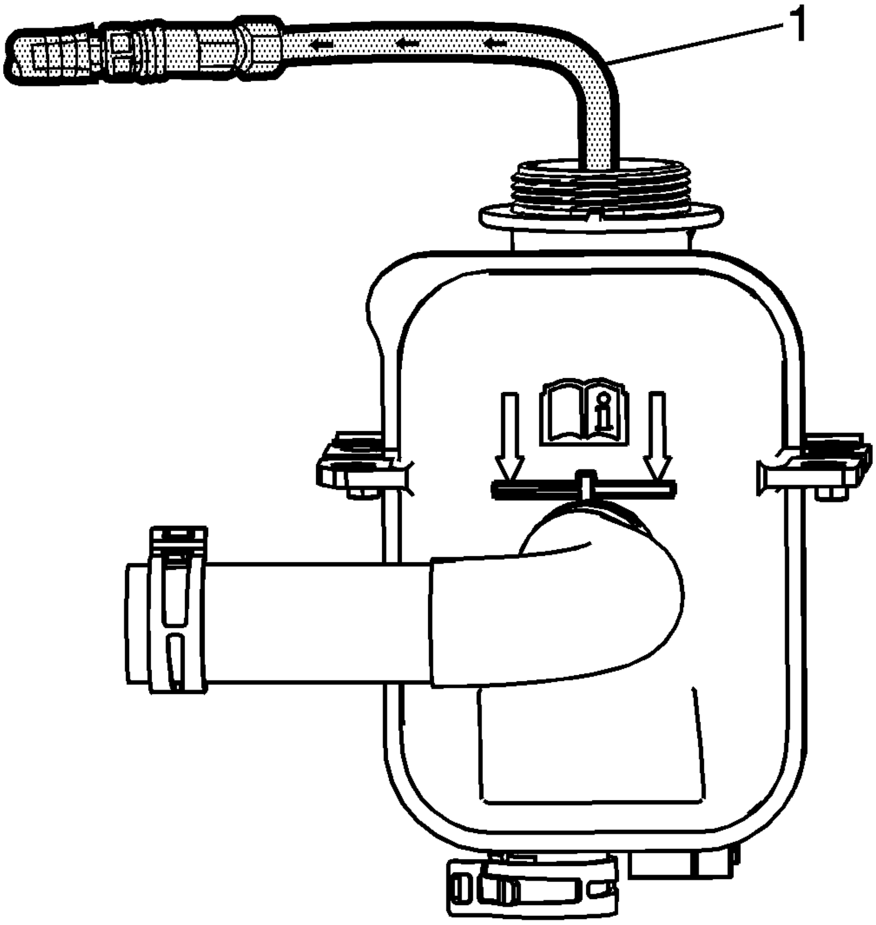

Fig. 54: Extraction Hose
Courtesy of GENERAL MOTORS COMPANY

4. Assemble the extraction hose (1) and insert into the surge tank.

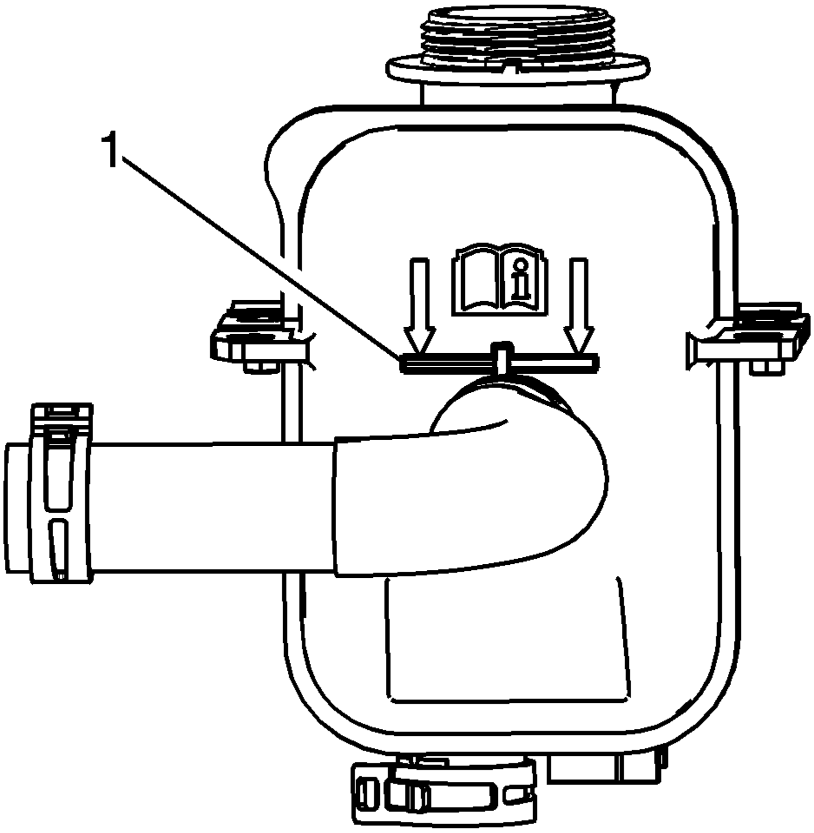

Fig. 55: Adjusting Surge Tank Coolant Level To Position Just Above Seam
Courtesy of GENERAL MOTORS COMPANY

5. Adjust the surge tank coolant level to a position just above the seam (1).
6. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

ELECTRIC DIFFERENTIAL DRIVE MOTOR POWER INVERTER MODULE COOLING HOSE REPLACEMENT (APM TO OBCM)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**

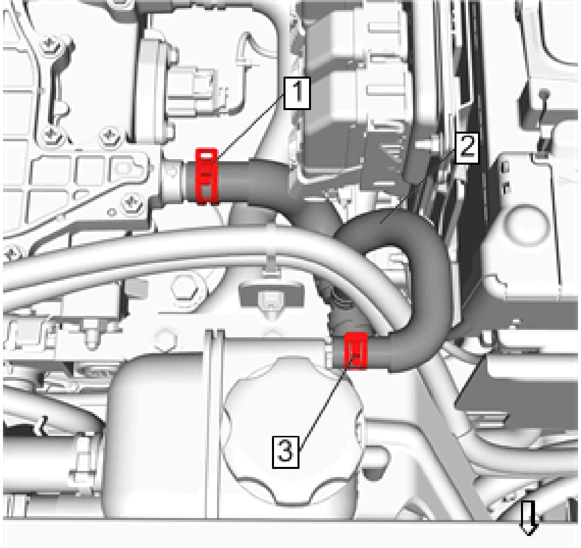

Fig. 56: Electric Differential Drive Motor Power Inverter Module Cooling Hose And Clamps
Courtesy of GENERAL MOTORS COMPANY

3. Disengage Clamps (1, 3) (Qty: 2). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
4. Remove the electric differential drive motor power inverter module cooling hose (2).

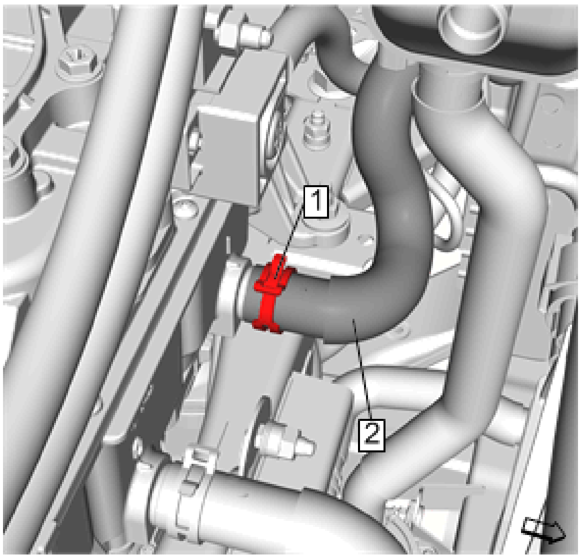

Fig. 57: Electric Differential Drive Motor Power Inverter Module Cooling Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

5. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
6. Remove the electric differential drive motor power inverter module cooling hose (2).

Installation Procedure

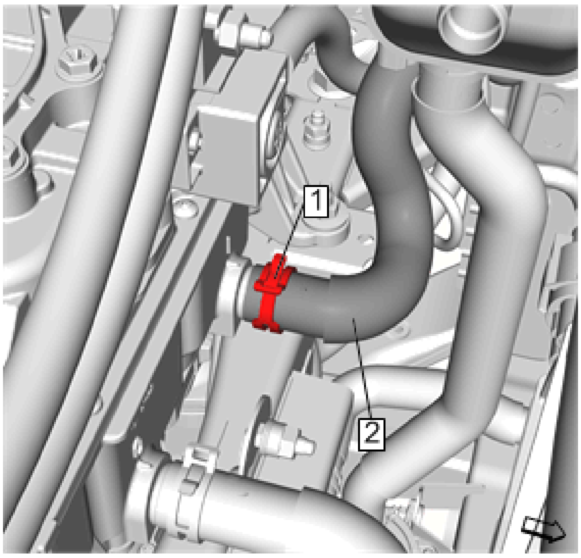

Fig. 58: Electric Differential Drive Motor Power Inverter Module Cooling Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install the electric differential drive motor power inverter module cooling hose (2).
2. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**

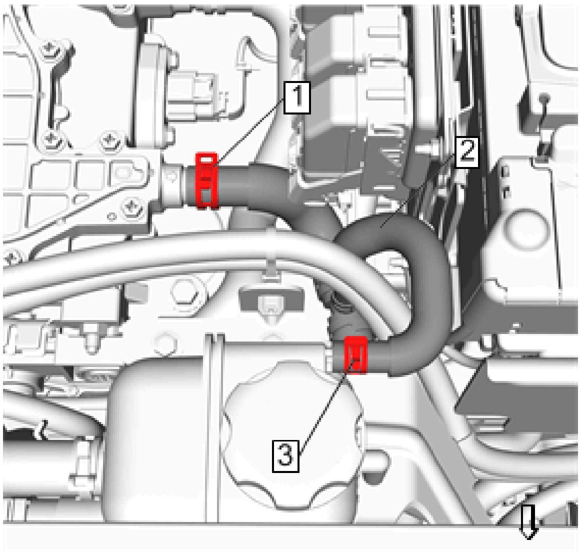

Fig. 59: Electric Differential Drive Motor Power Inverter Module Cooling Hose And Clamps
Courtesy of GENERAL MOTORS COMPANY

3. Install the electric differential drive motor power inverter module cooling hose (2).
4. Engage Clamps (1, 3) (Qty: 2). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
5. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
6. Check the cooling system for leaks.

DRIVE MOTOR BATTERY COOLANT LEVEL SENSOR REPLACEMENT

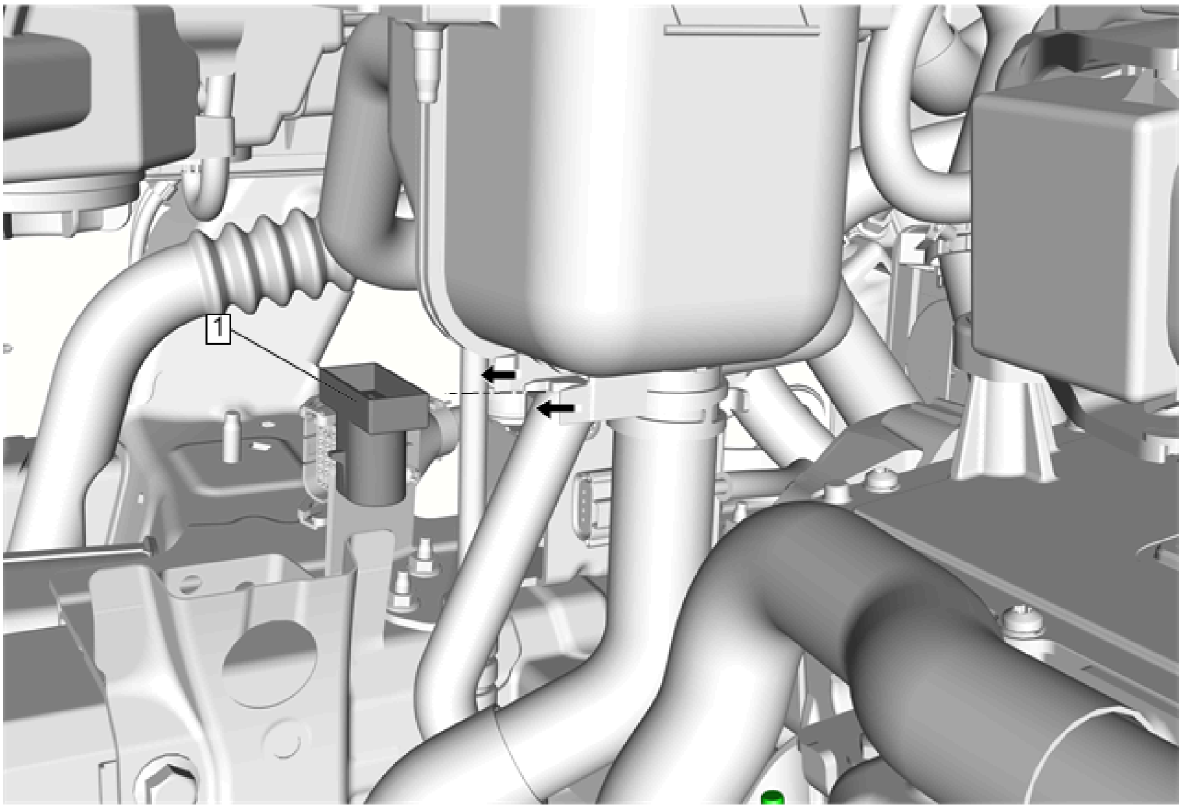

Fig. 60: Drive Motor Battery Coolant Level Sensor

18. Install Front Compartment Front Sight Shield (3). Refer to **Front Compartment Front Sight Shield Replacement**
19. Recharge the refrigerant. Refer to **Refrigerant Recovery and Recharging**
20. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**.
21. Check the cooling system for leaks.
22. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection**

GENERATOR CONTROL MODULE COOLANT TANK HOSE REPLACEMENT (DU TO SURGE TANK)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

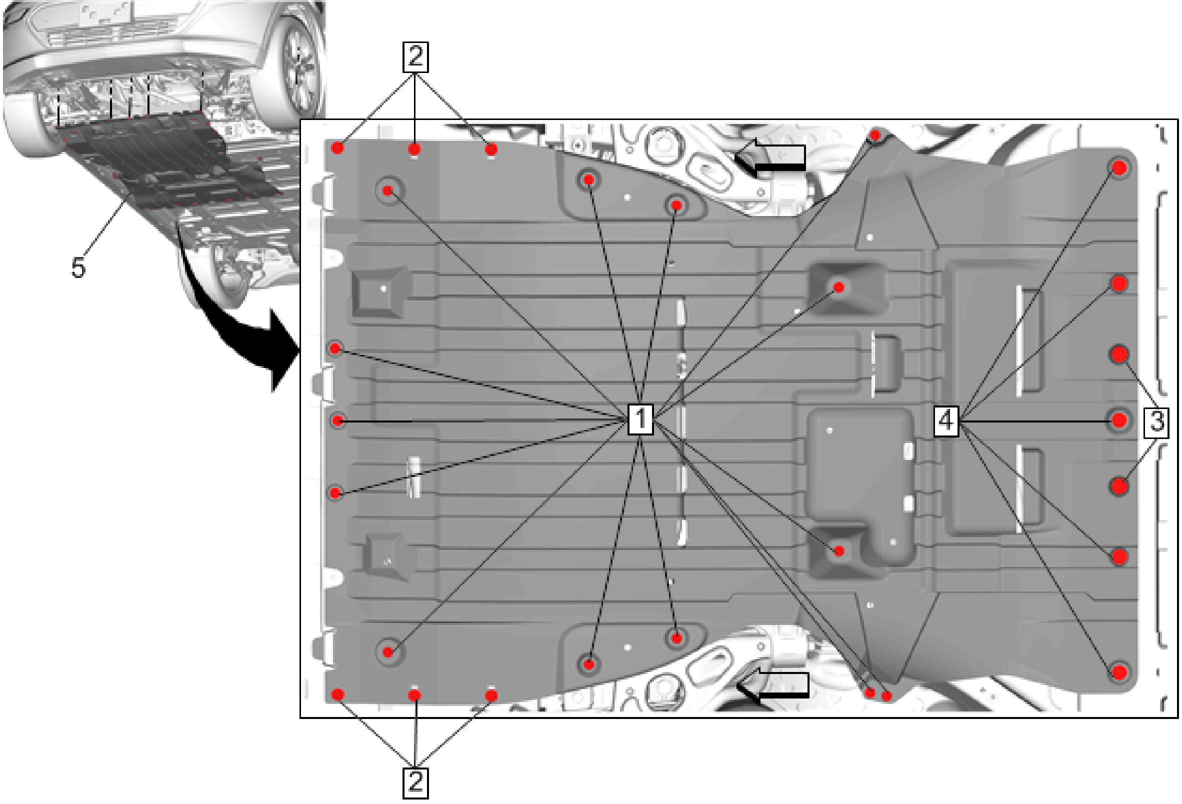

Fig. 89: Front Compartment Air Deflector And Fasteners
Courtesy of GENERAL MOTORS COMPANY

2. Remove Front Compartment Air Deflector (5). Refer to **Front Compartment Air Deflector Replacement**
3. Drain the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**

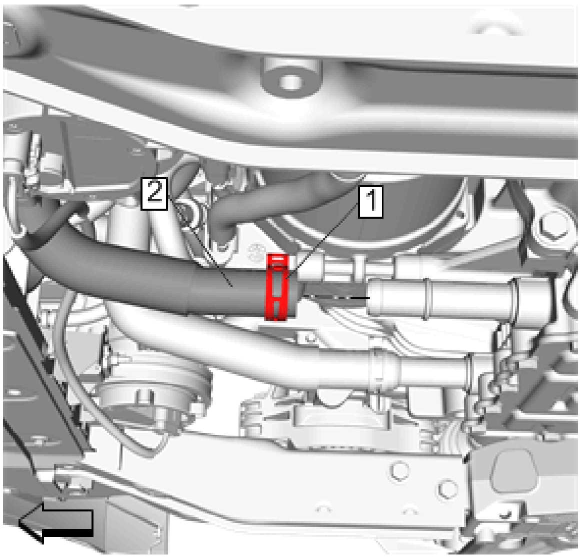

Fig. 90: Generator Control Module Coolant Tank Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
5. Remove Generator Control Module Coolant Tank Hose (2)

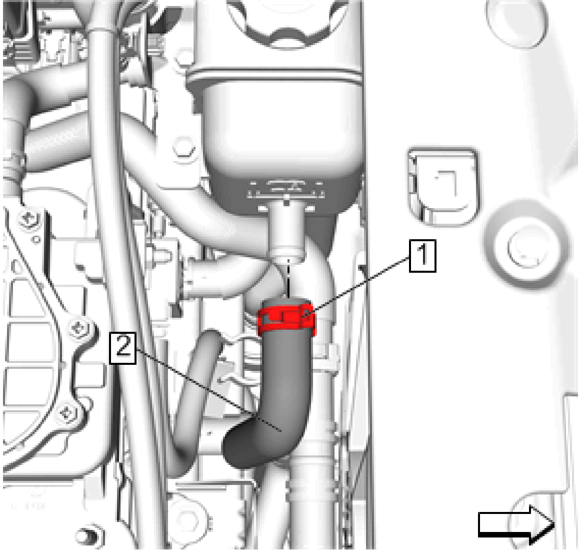

Fig. 91: Generator Control Module Coolant Tank Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

6. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
7. Remove Generator Control Module Coolant Tank Hose (2)

Installation Procedure

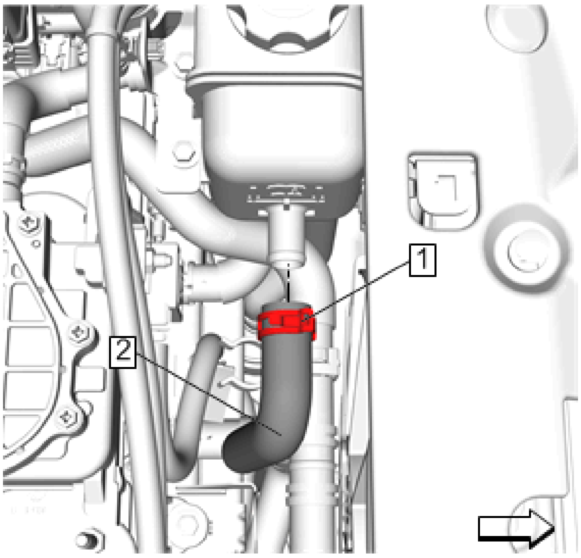

Fig. 92: Generator Control Module Coolant Tank Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install Generator Control Module Coolant Tank Hose (2)
2. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**

8. Install the left front side of radiator surge tank support bracket (4). Refer to Radiator Surge Tank Support Bracket Replacement (Radiator).

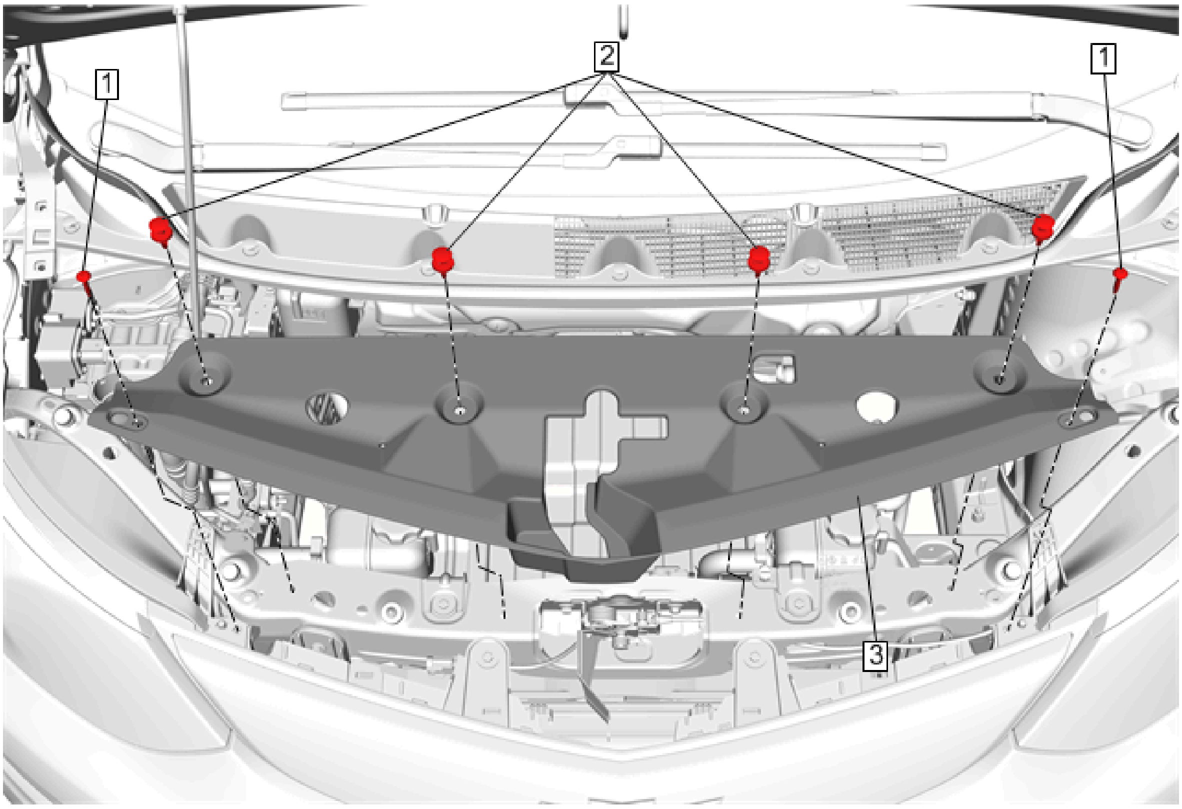

Fig. 100: Front Compartment Front Sight Shield
Courtesy of GENERAL MOTORS COMPANY

9. Install Front Compartment Front Sight Shield (3). Refer to Front Compartment Front Sight Shield Replacement
10. Fill the drive motor generator power inverter module cooling system. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling
11. Check the cooling system for leaks.

RADIATOR SURGE TANK SUPPORT BRACKET REPLACEMENT (RADIATOR)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any**

cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

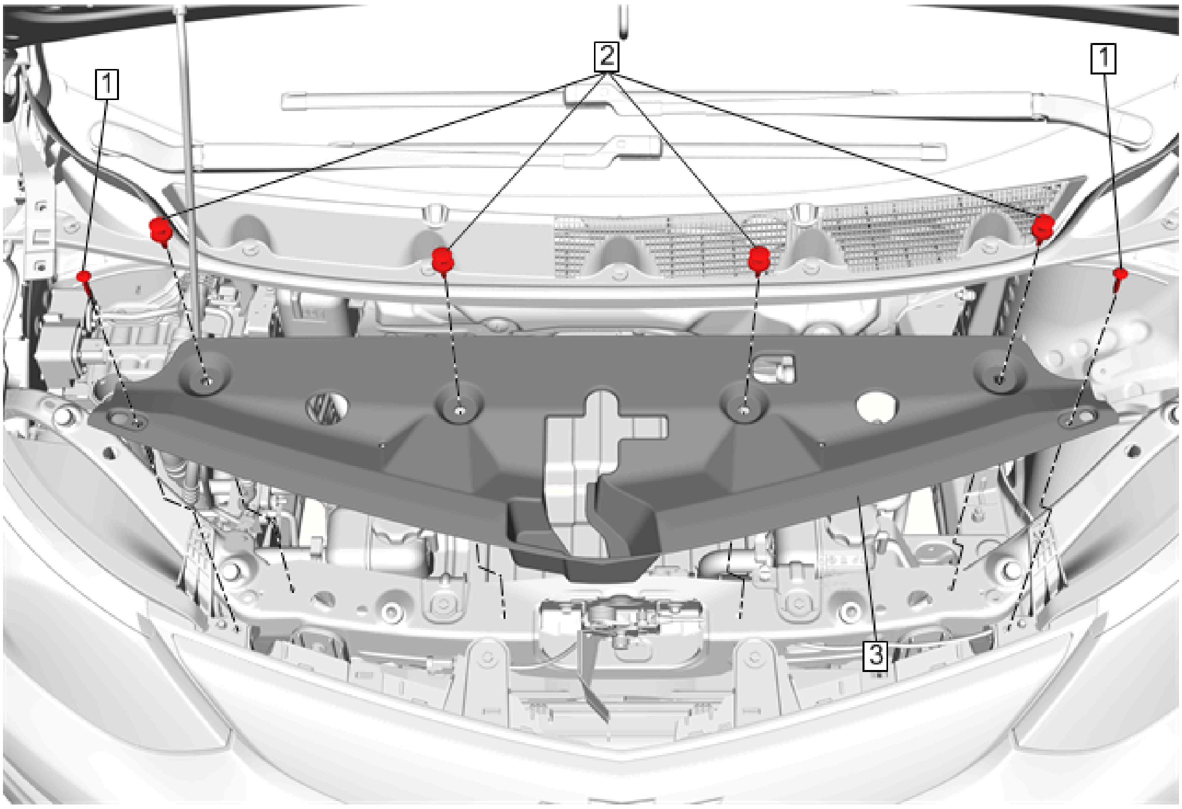

Fig. 101: Front Compartment Front Sight Shield
Courtesy of GENERAL MOTORS COMPANY

1. Remove Front Compartment Front Sight Shield (3). Refer to Front Compartment Front Sight Shield Replacement

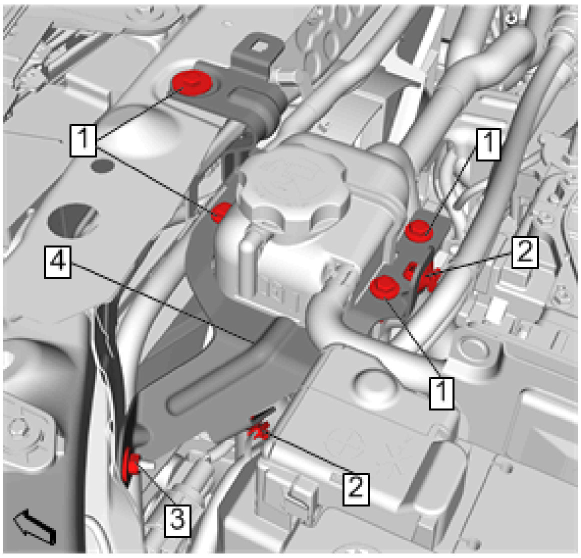

Fig. 102: Radiator Surge Tank Support Bracket And Fasteners (Left Front Side)
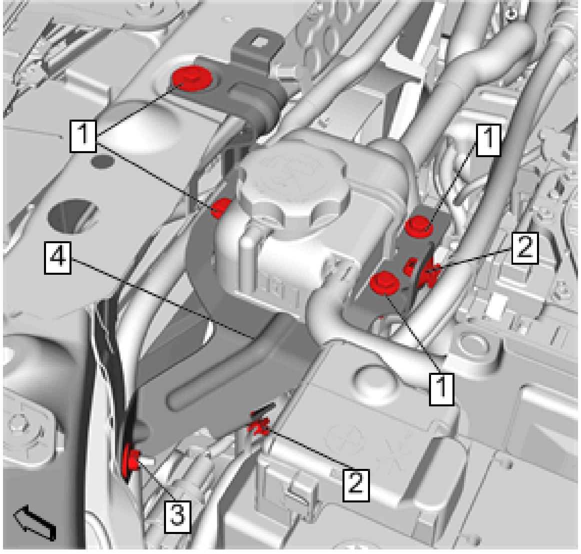
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not remove any coolant hoses from the surge tanks.**

2. Remove the 4 radiator surge tank support bracket bolts. (1)
3. Remove the radiator surge tank support bracket nut. (3)
4. {If equipped} Remove Retainers (2) (Qty: 2)
5. Remove the radiator surge tank support bracket. (4)

Installation Procedure



[Fig. 103: Radiator Surge Tank Support Bracket And Fasteners (Left Front Side)](#)
Courtesy of GENERAL MOTORS COMPANY

1. Install the radiator surge tank support bracket. (4)

CAUTION: **Refer to [Fastener Caution](#)**

2. Install the radiator surge tank support bracket nut (3) and tighten to 9 N.m (80 lb in)
3. Install the 4 radiator surge tank support bracket bolts (1) and tighten to 9 N.m (80 lb in)
4. {If equipped} Install Retainers (2) (Qty: 2)

11. Install Radiator Air Upper Baffle and Deflector (2). Refer to **Radiator Air Upper Baffle and Deflector Replacement**
12. Install Front Bumper Fascia. Refer to **Front Bumper Fascia Replacement (North America)** **Front Bumper Fascia Replacement (Europe, Korea)**

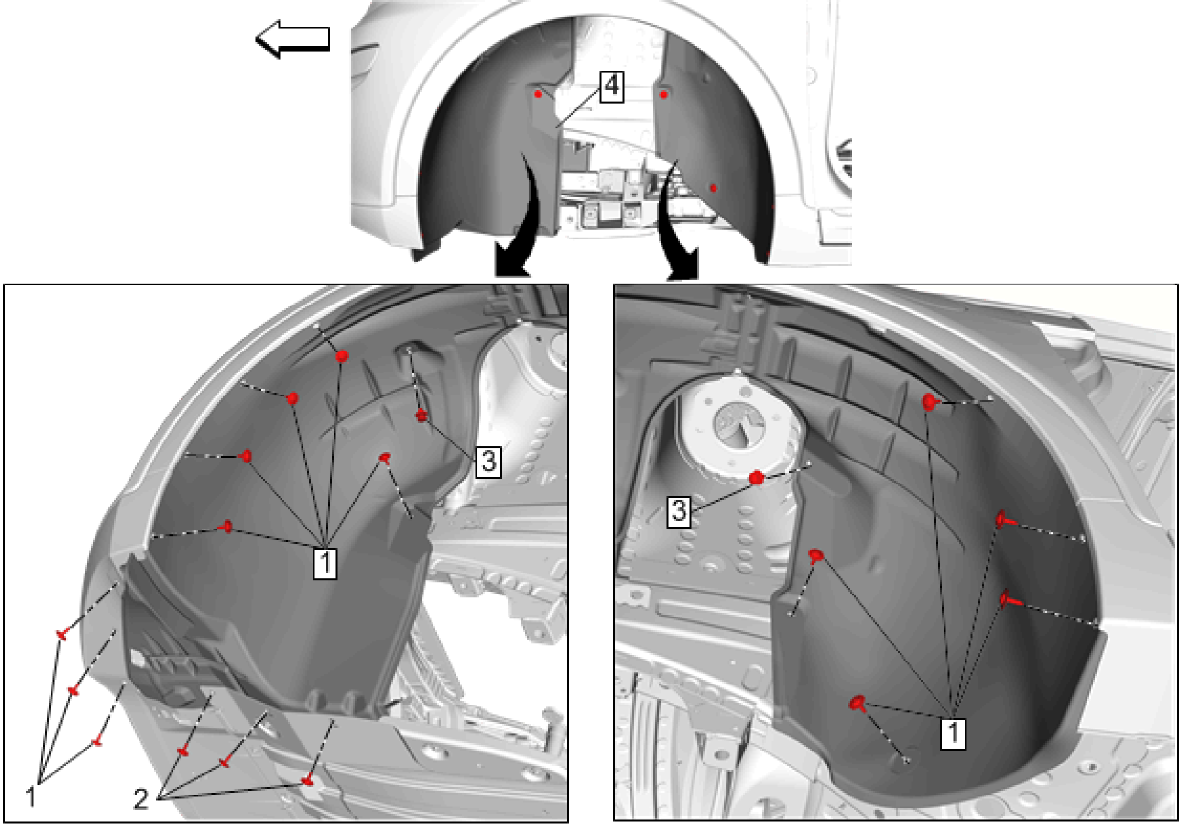

Fig. 134: Front Wheelhouse Liner
Courtesy of GENERAL MOTORS COMPANY

13. Install Front Wheelhouse Liner (4) (Qty: 2). Refer to **Front Wheelhouse Liner Replacement**

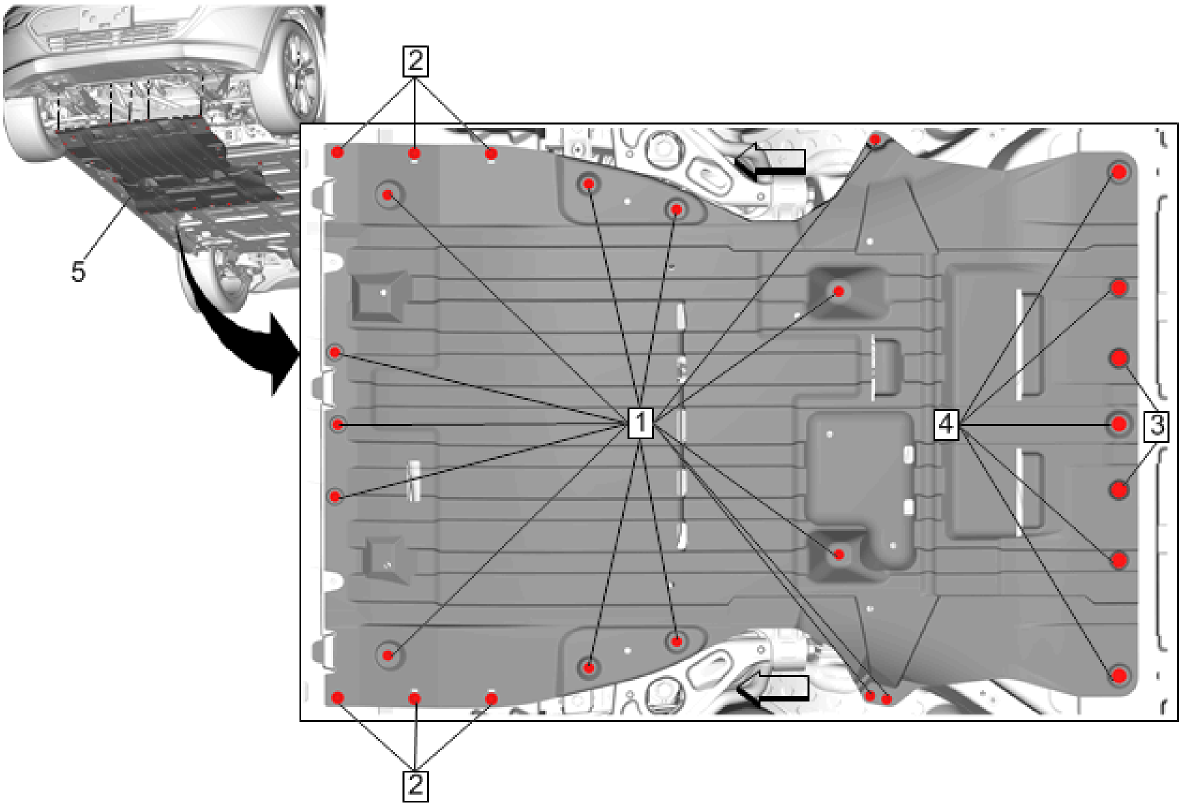

Fig. 135: Front Compartment Air Deflector And Fasteners
Courtesy of GENERAL MOTORS COMPANY

14. Install Front Compartment Air Deflector (5). Refer to **Front Compartment Air Deflector Replacement**

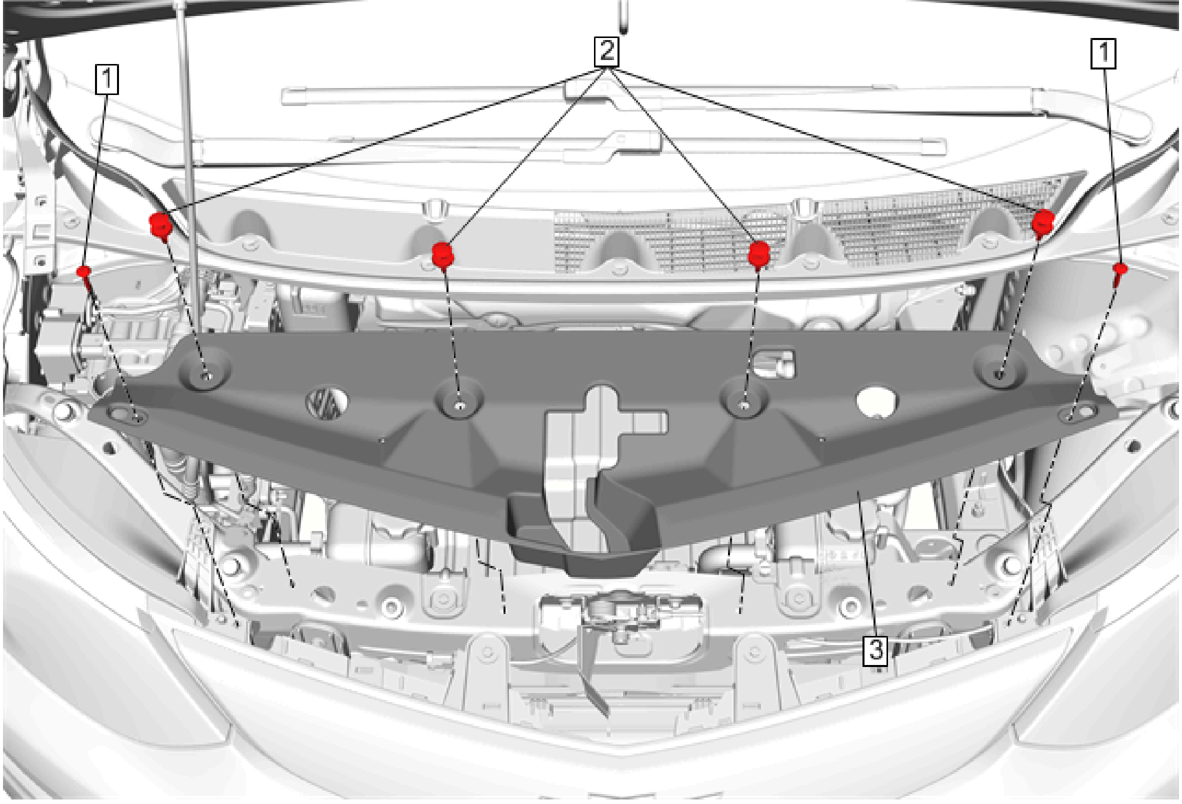

Fig. 136: Front Compartment Front Sight Shield
Courtesy of GENERAL MOTORS COMPANY

15. Install Front Compartment Front Sight Shield (3). Refer to Front Compartment Front Sight Shield Replacement
16. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection

ENGINE COOLANT TEMPERATURE SENSOR REPLACEMENT - RADIATOR SIDE

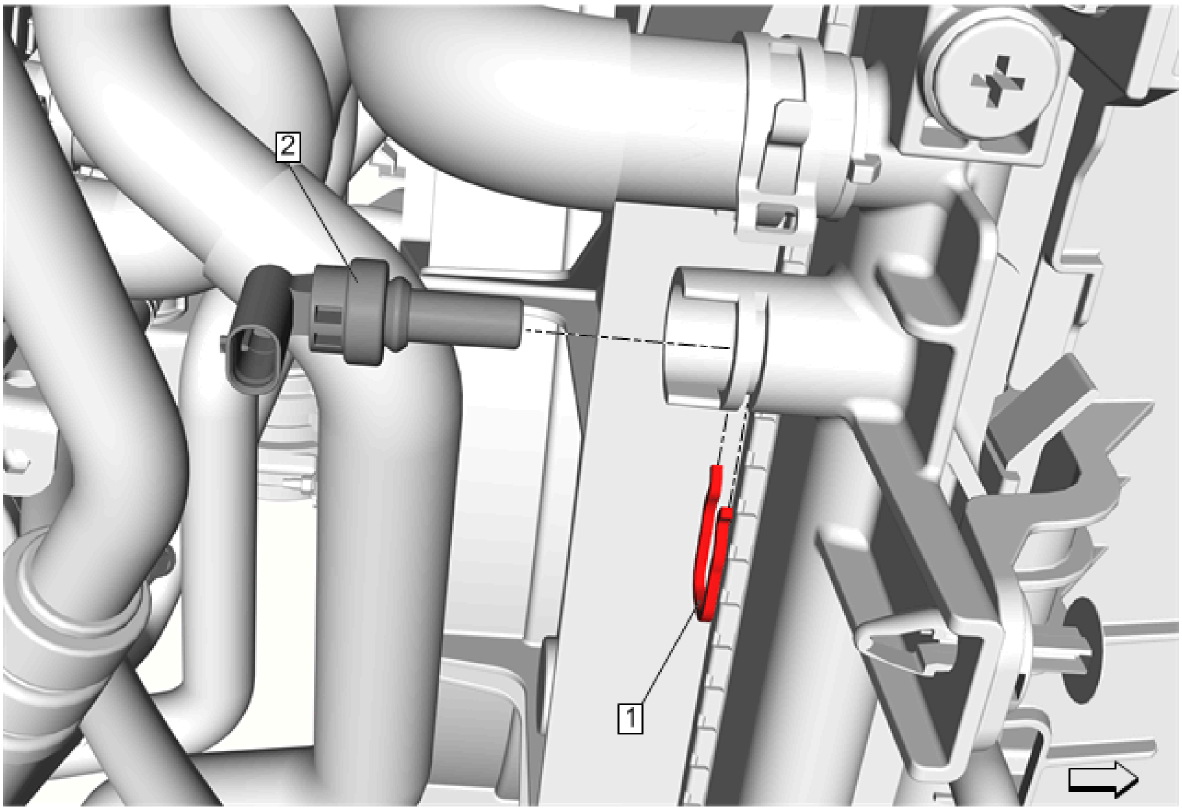

Fig. 137: Engine Coolant Temperature Sensor - Radiator Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** 2. Remove the RESS surge tank bracket. Refer to **Radiator Surge Tank Support Bracket Replacement (RESS)** 3. Disconnect the electrical connector from the engine coolant temperature sensor.	
1	Engine Coolant Temperature Sensor Retainer
2	Engine Coolant Temperature Sensor **Procedure** After replacement, connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection**

RADIATOR DRAIN COCK REPLACEMENT

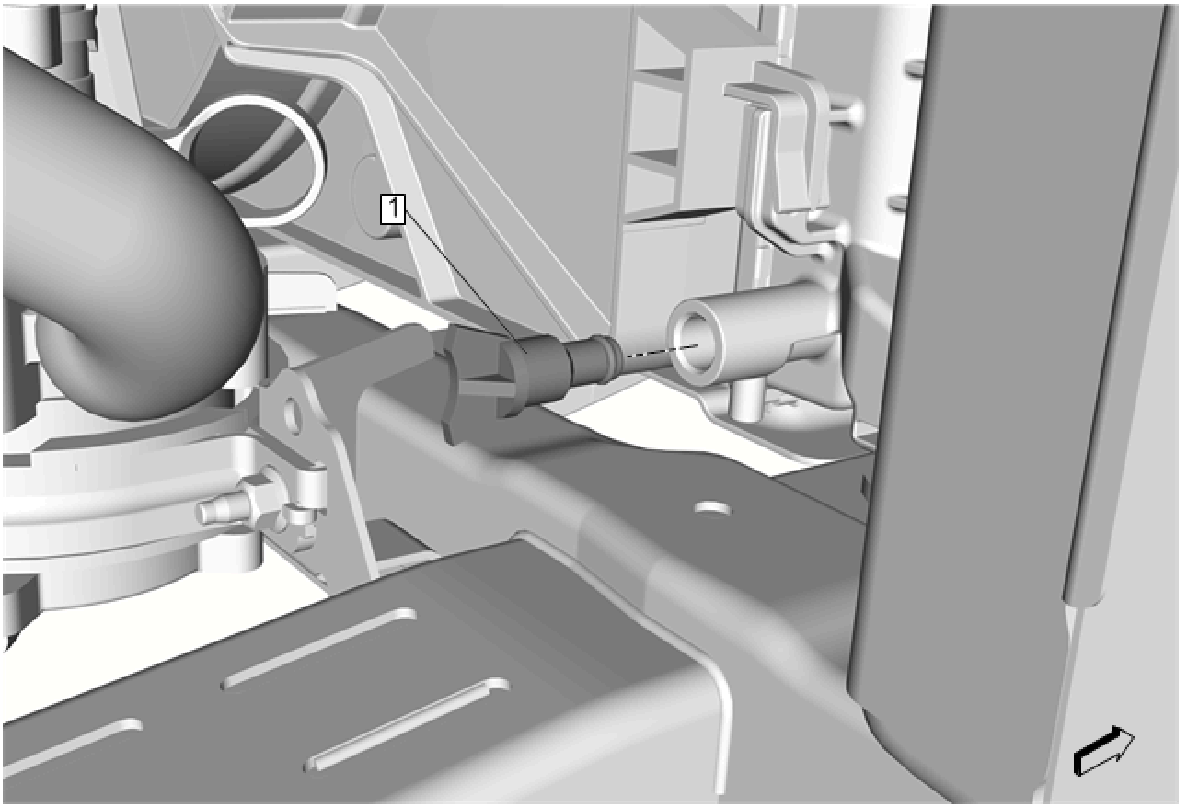

Fig. 138: Radiator Drain Cock
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.** **Preliminary Procedures** 1. Remove the right front wheelhouse liner. Refer to **Front Wheelhouse Liner Replacement** 2. Remove the front compartment air deflector. Refer to **Front Compartment Air Deflector Replacement** 3. Drain the drive motor cooling system. Refer to **Drive Motor Battery Cooling System Draining and Filling**	

Callout	Component Name
1	Radiator Drain Cock **CAUTION:** **Refer to Fastener Caution .** **Procedures** 1. Reposition the lower portion of the fascia to access the drain port. 2. Attach a rubber hose to the drive motor battery coolant radiator drain port. 3. Place a drain pan under the left side of the drive motor battery coolant radiator. 4. After installation, fill the coolant reservoir to the fill level. Refer to **Drive Motor Battery Cooling System Draining and Filling** 5. Inspect cooling system for leaks.

RADIATOR LOWER INSULATOR REPLACEMENT

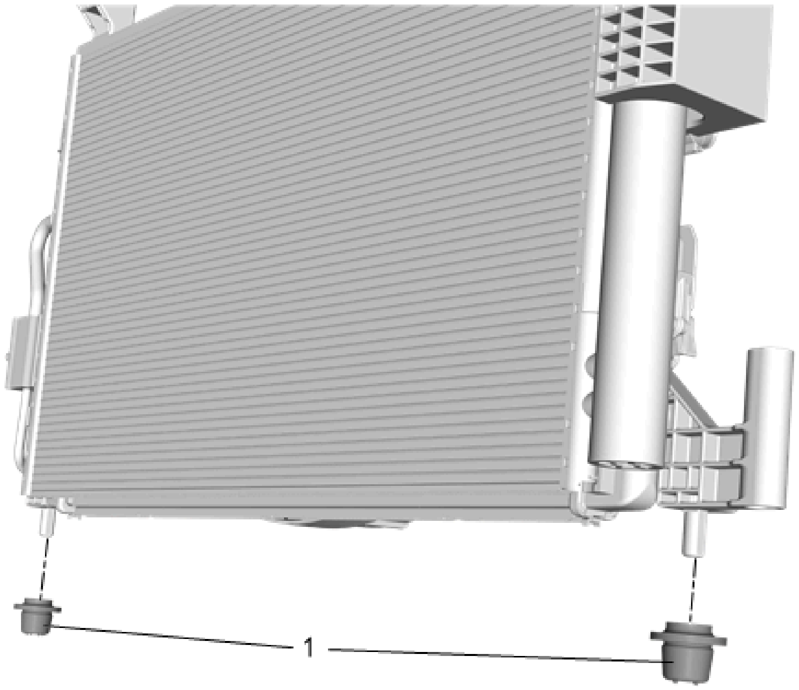

Fig. 139: Radiator Lower Insulator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Front Bumper Fascia. Refer to **Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)** 2. Remove Radiator Upper Bracket. Refer to **Radiator Upper Bracket Replacement**	
1	Radiator Lower Insulator

RADIATOR UPPER BRACKET REPLACEMENT

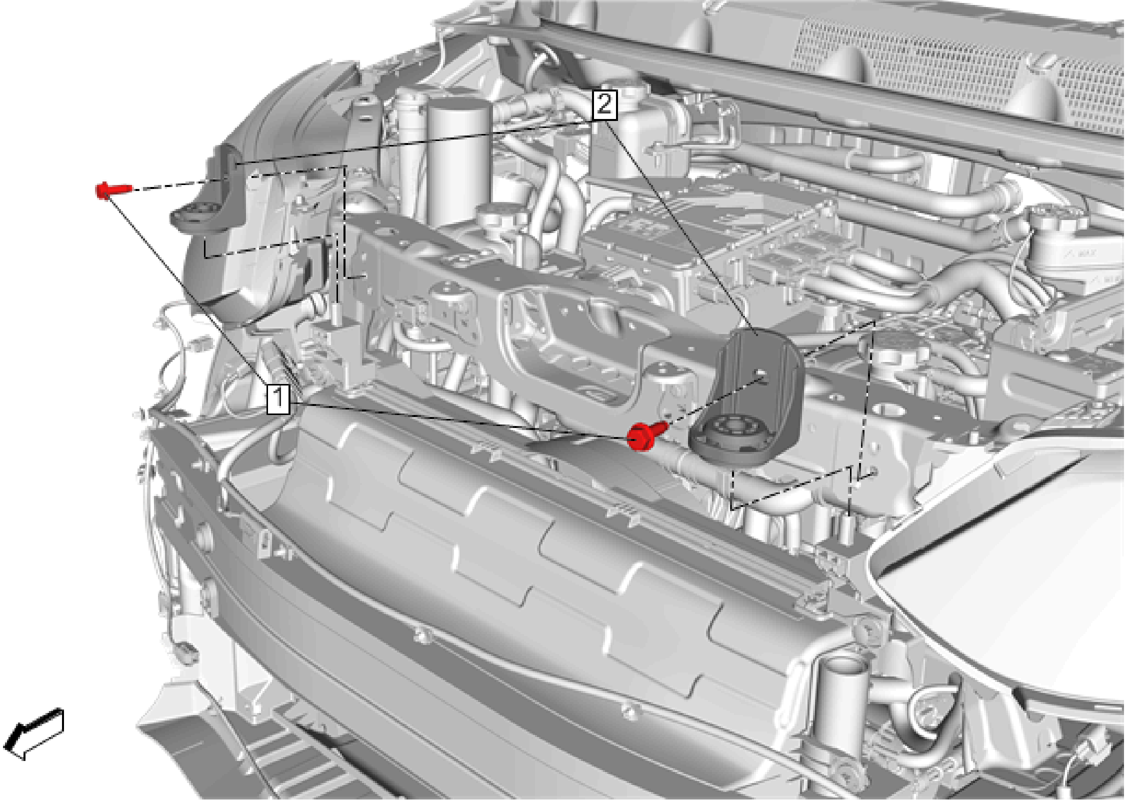

Fig. 140: Radiator Upper Brackets
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Compartment Front Sight Shield. Refer to **Front Compartment Front Sight Shield Replacement**	
1	Radiator Upper Bracket Fastener (Qty: 2) **CAUTION:** **Refer to Fastener Caution** 22 N.m (16 lb ft)
2	Radiator Upper Bracket

RADIATOR VENT VALVE REPLACEMENT

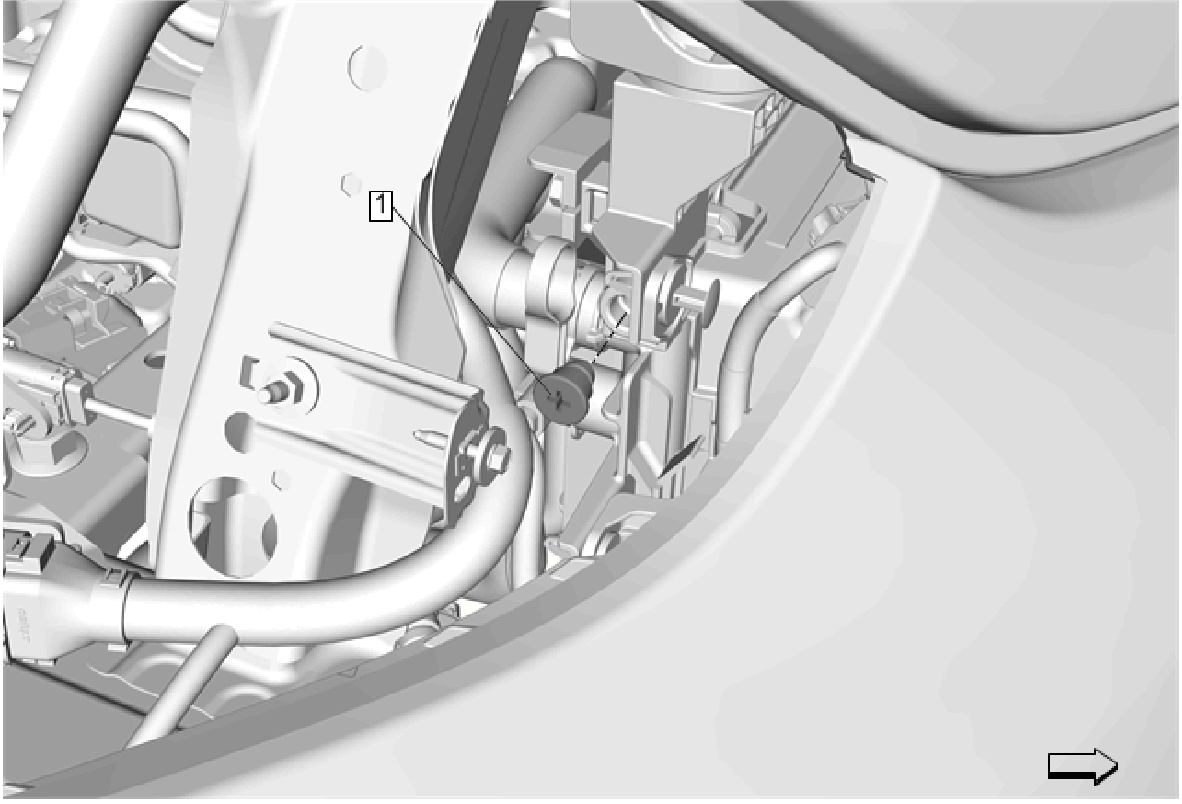

Fig. 141: Radiator Vent Valve
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Bumper Fascia. Refer to Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)	
1	Radiator Vent Valve **CAUTION:** **Refer to Fastener Caution** 1.9 N.m (17 lb in)

RADIATOR PROTECTOR REPLACEMENT

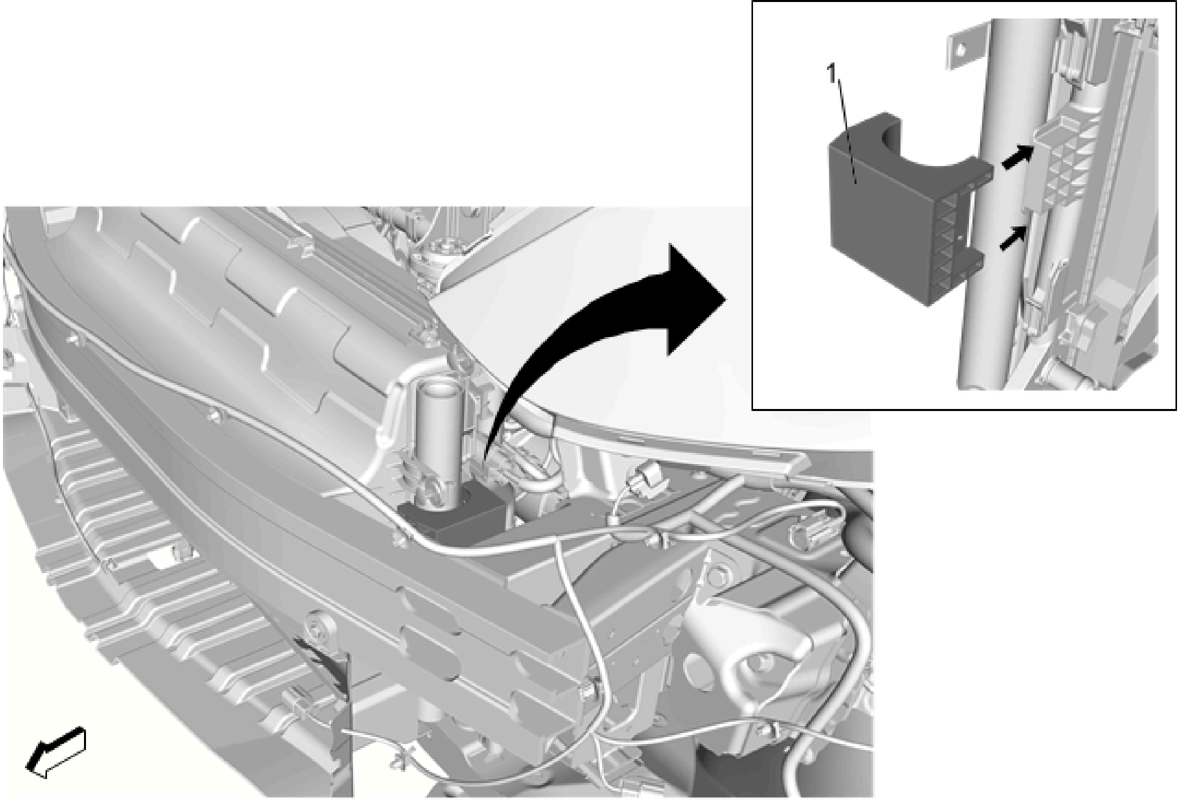

Fig. 142: Radiator Protector
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Bumper Fascia. Refer to Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)	
1	Radiator Protector **Procedure** Using a flat bladed tool, work the protector off of the radiator towards the drivers slide of the vehicle. Reposition the radiator as necessary.

DRIVE MOTOR GENERATOR CONTROL MODULE COOLANT PUMP HOSE REPLACEMENT (SURGE TANK TO PUMP)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain the drive motor generator power inverter module cooling system. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling
3. Remove Front Compartment Front Sight Shield. Refer to Front Compartment Front Sight Shield Replacement

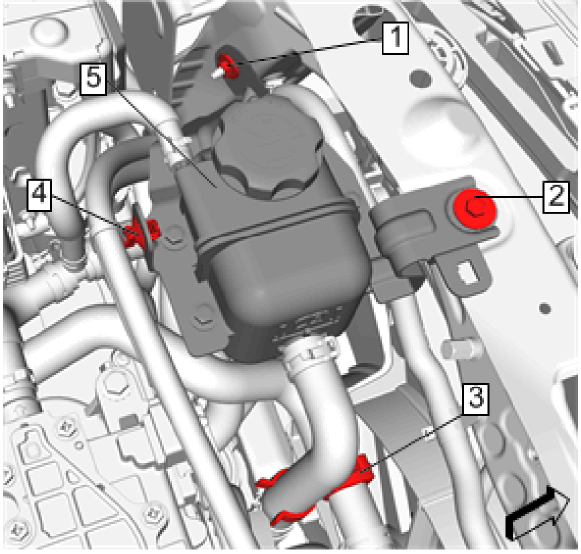

Fig. 143: Radiator Surge Tank Assembly And Fasteners
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not remove any coolant hoses from the surge tanks.**

4. Remove Radiator Surge Tank Bracket Bolt (2)
5. Remove Radiator Surge Tank Bracket Nut (1)
6. {If equipped} Remove Retainers (3, 4)
7. To gain access to the second radiator inlet hose clamp, lay the radiator surge tank assembly (5) aside.

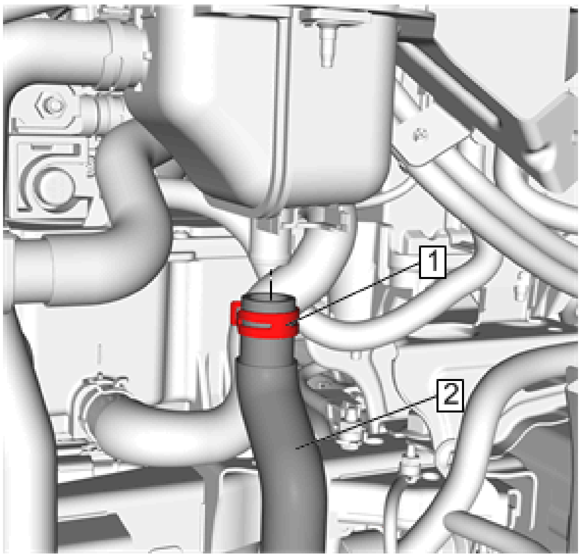

Fig. 144: Drive Motor Generator Control Module Coolant Pump Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

8. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
9. Remove Drive Motor Generator Control Module Coolant Pump Hose (2)
10. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
11. Disconnect the pump electrical connector.
12. Remove the pump/hose assembly from the vehicle. Refer to **Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump)**

NOTE: **The drain procedure has the technician remove the pump fasteners and one of the hoses. It is better to disconnect the pump electrical, and remove the pump/hose together.**

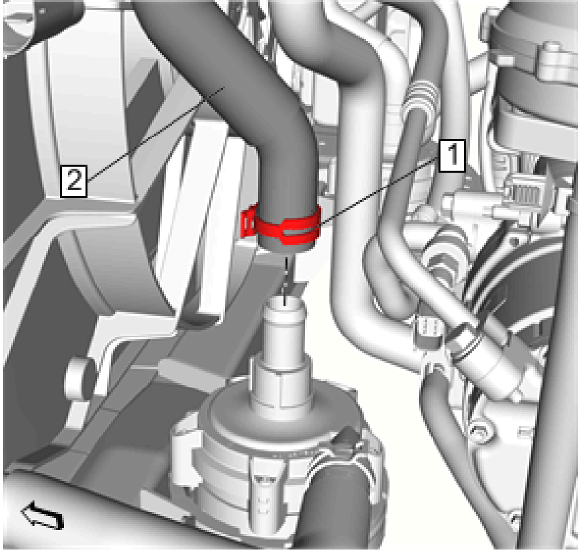

Fig. 145: Drive Motor Generator Control Module Coolant Pump Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

13. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
14. Remove Drive Motor Generator Control Module Coolant Pump Hose (2)

Installation Procedure

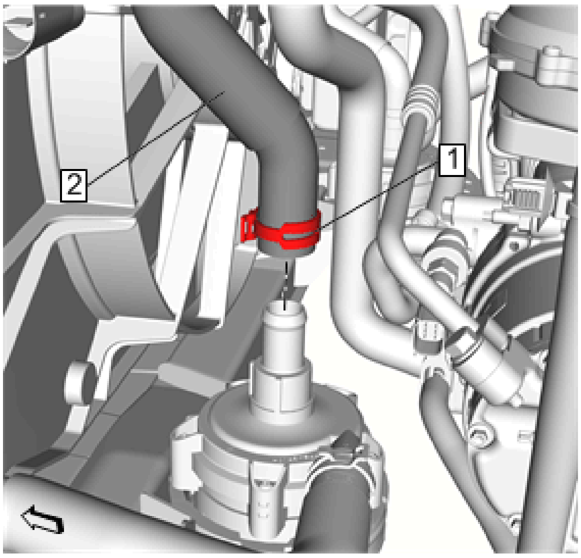

Fig. 146: Drive Motor Generator Control Module Coolant Pump Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Generator Control Module Coolant Pump Hose (2)
2. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
3. Install the pump/hose assembly to the vehicle. Refer to **Drive Motor Battery Coolant Pump Replacement (RESS Pump)Drive Motor Battery Coolant Pump Replacement (PE Pump)**
4. Connect the pump electrical connector.

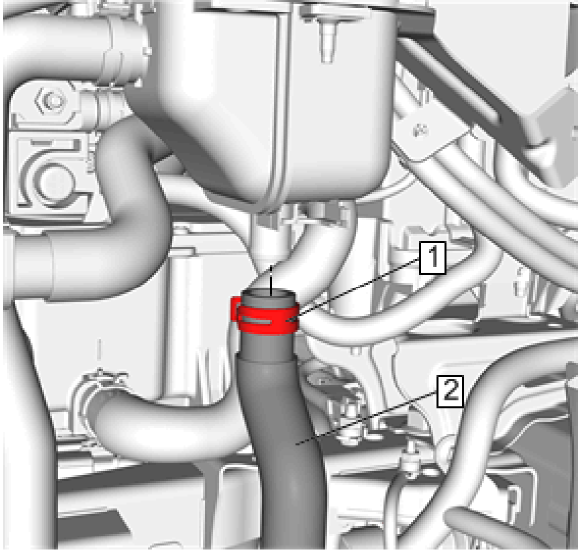

Fig. 147: Drive Motor Generator Control Module Coolant Pump Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

5. Install Drive Motor Generator Control Module Coolant Pump Hose (2)
6. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
7. Install Radiator Surge Tank (5)

CAUTION: **Refer to Fastener Caution**

8. Install and tighten Radiator Surge Tank Bracket Nut (1) to 9 N.m (80 lb in)
9. Install and tighten Radiator Surge Tank Bracket Bolt (2) to 9 N.m (80 lb in)
10. {If Equipped} Install Retainers (3, 4)
11. Install Front Compartment Front Sight Shield. Refer to **Front Compartment Front Sight Shield Replacement**
12. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
13. Check the cooling system for leaks.

DRIVE MOTOR GENERATOR CONTROL MODULE COOLING OUTLET HOSE REPLACEMENT (SPIM TO APM)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**

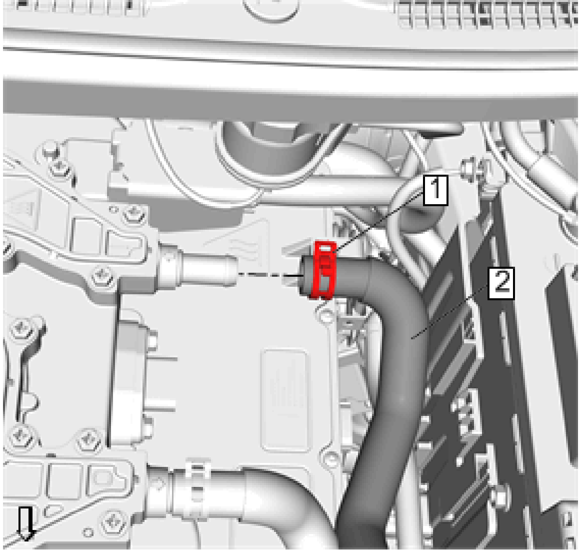

Fig. 148: Drive Motor Generator Control Module Cooling Outlet Hose
Courtesy of GENERAL MOTORS COMPANY

3. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
4. Remove Drive Motor Generator Control Module Cooling Outlet Hose (2)

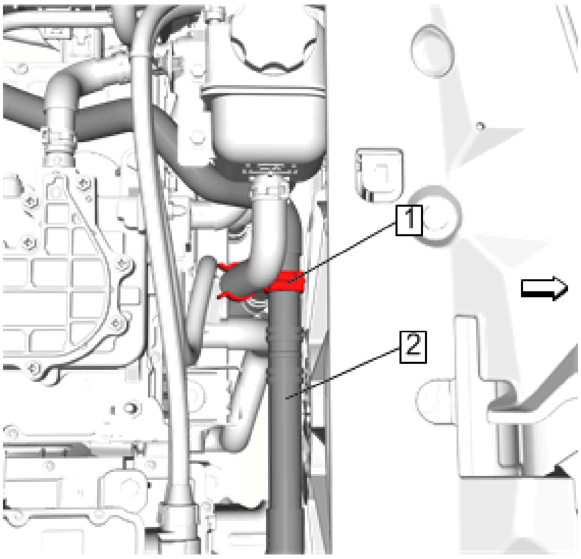

Fig. 149: Drive Motor Generator Control Module Cooling Outlet Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

5. Remove Retainer (1)
6. Remove Drive Motor Generator Control Module Cooling Outlet Hose (2)
7. Remove the RESS surge tank bracket and reposition the surge tank. Refer to **Radiator Surge Tank Support Bracket Replacement (RESS)**

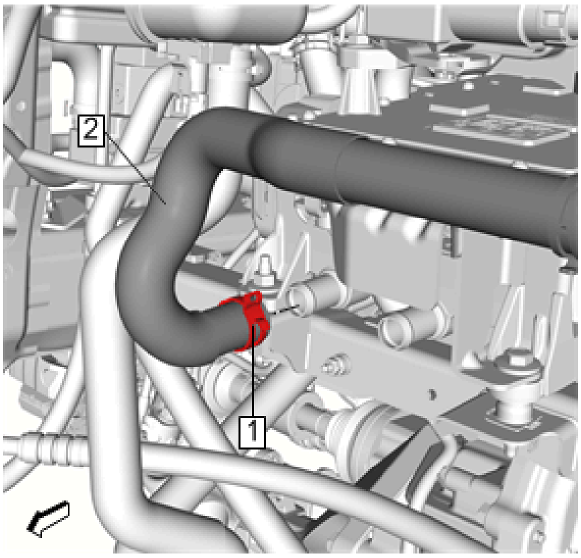

Fig. 150: Drive Motor Generator Control Module Cooling Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

8. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
9. Remove Drive Motor Generator Control Module Cooling Outlet Hose (2)

Installation Procedure

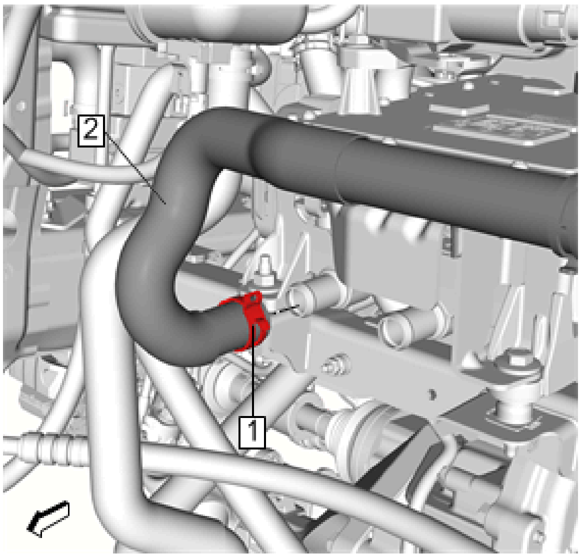

Fig. 151: Drive Motor Generator Control Module Cooling Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Generator Control Module Cooling Outlet Hose (2)
2. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
3. Position the surge tank and install the RESS surge tank bracket. Refer to **Radiator Surge Tank Support Bracket Replacement (RESS)**

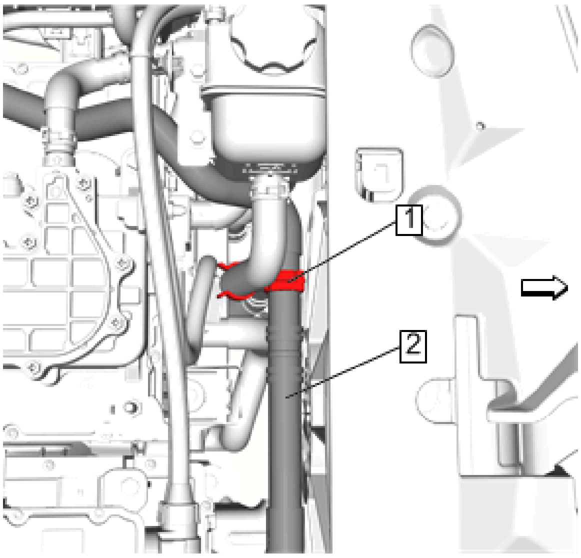

Fig. 152: Drive Motor Generator Control Module Cooling Outlet Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

4. Install Retainer (1)
5. Install Drive Motor Generator Control Module Cooling Outlet Hose (2)

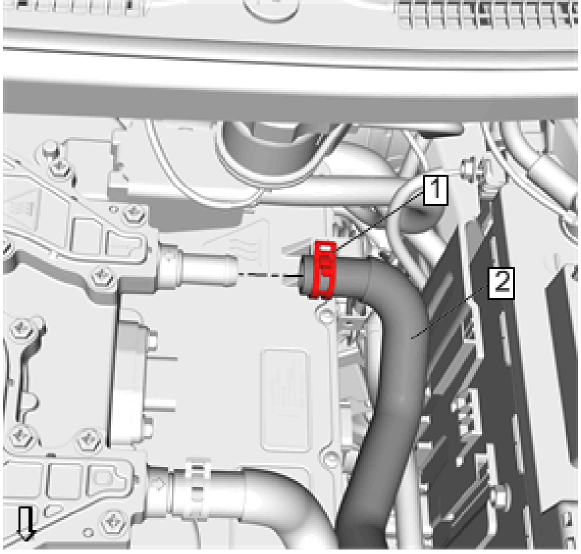

Fig. 153: Drive Motor Generator Control Module Cooling Outlet Hose
Courtesy of GENERAL MOTORS COMPANY

6. Install Drive Motor Generator Control Module Cooling Outlet Hose (2)
7. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
8. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
9. Check the cooling system for leaks.

DRIVE MOTOR GENERATOR CONTROL MODULE RADIATOR INLET HOSE REPLACEMENT (PUMP TO RADIATOR)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Remove Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
3. Remove Front Wheelhouse Liner-Left Side. Refer to **Front Wheelhouse Liner Replacement**
4. Drain the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**

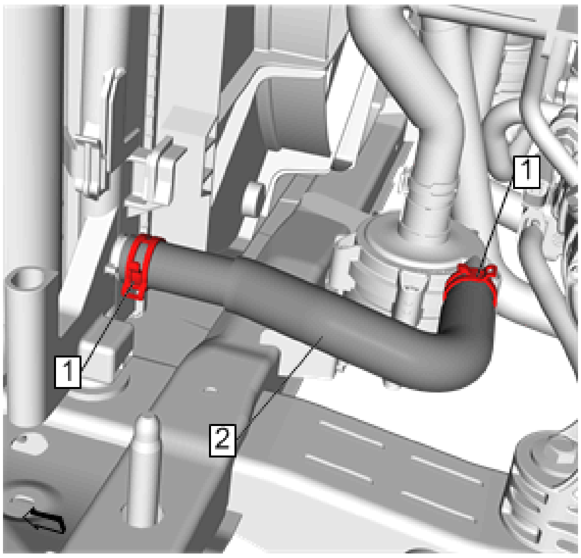

Fig. 154: Drive Motor Generator Control Module Radiator Inlet Hose And Clamps
Courtesy of GENERAL MOTORS COMPANY

5. Disengage Clamps (1) (Qty: 2). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
6. Remove Drive Motor Generator Control Module Radiator Inlet Hose (2)

Installation Procedure

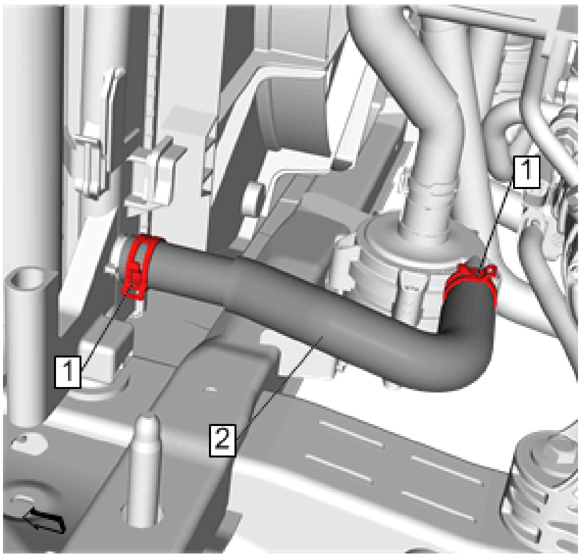

Fig. 155: Drive Motor Generator Control Module Radiator Inlet Hose And Clamps
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Generator Control Module Radiator Inlet Hose (2)
2. Engage Clamps (1) (Qty: 2). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
3. Install Front Wheelhouse Liner-Left Side. Refer to **Front Wheelhouse Liner Replacement**
4. Install Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
5. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
6. Check the cooling system for leaks.

DRIVE MOTOR GENERATOR CONTROL MODULE RADIATOR OUTLET HOSE REPLACEMENT (RADIATOR TO SPIM)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection**
3. Drain the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
4. Remove Front Compartment Front Sight Shield. Refer to **Front Compartment Front Sight Shield Replacement**

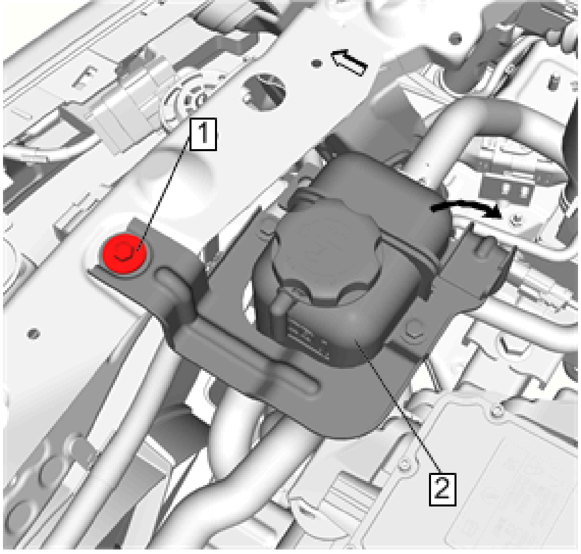

Fig. 156: Drive Motor Battery Radiator Surge Tank And Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Remove Drive Motor Battery Radiator Surge Tank Bracket Bolt (1)
6. Position aside drive motor battery radiator surge tank (2).

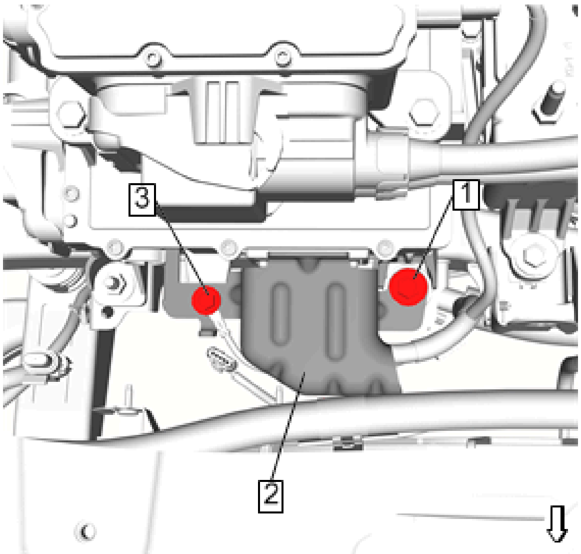

Fig. 157: Drive Motor Power Inverter Module Shield And Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove Drive Motor Power Inverter Module Shield Bolt (1)
8. Remove Ground Cable Bolt (3) @ Drive Motor Power Inverter Module
9. Remove Drive Motor Power Inverter Module Shield (2)

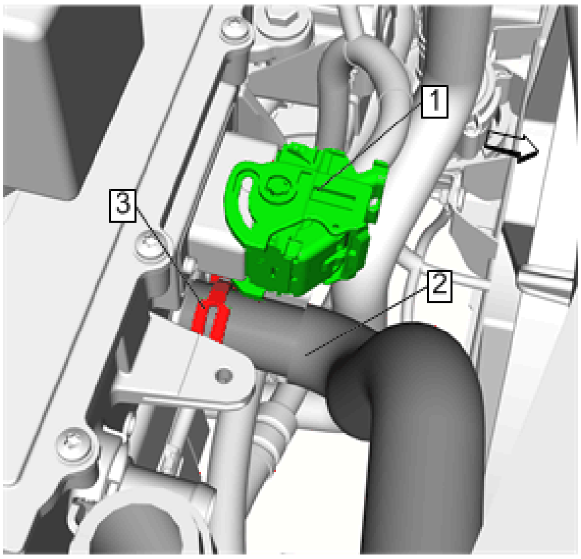

Fig. 158: Drive Motor Generator Control Module Radiator Outlet Hose, Clamp And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

10. Disconnect Electrical Connector (1)
11. Disengage Clamp (3). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
12. Remove Drive Motor Generator Control Module Radiator Outlet Hose (2)

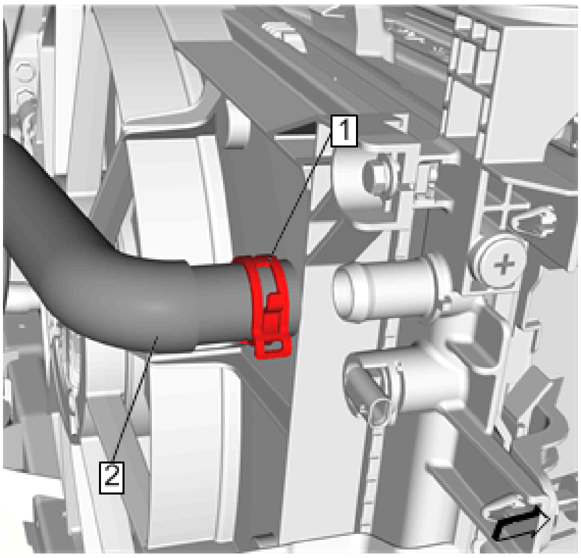

Fig. 159: Drive Motor Generator Control Module Radiator Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

13. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
14. Remove Drive Motor Generator Control Module Radiator Outlet Hose (2)

Installation Procedure

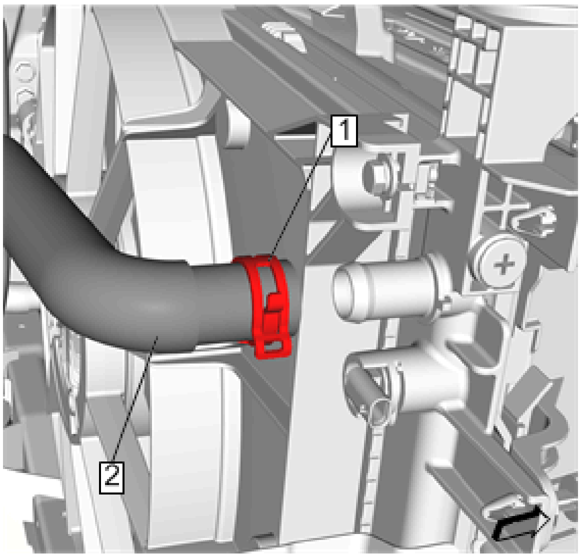

Fig. 160: Drive Motor Generator Control Module Radiator Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Generator Control Module Radiator Outlet Hose (2)
2. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**

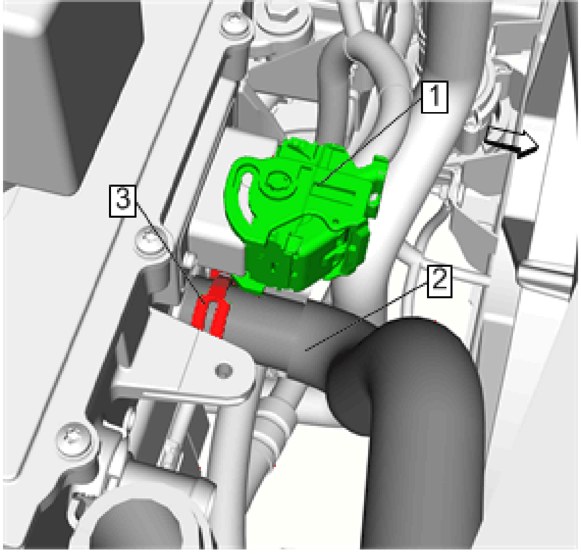

Fig. 161: Drive Motor Generator Control Module Radiator Outlet Hose, Clamp And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

3. Install Drive Motor Generator Control Module Radiator Outlet Hose (2)
4. Engage Clamp (3). Refer to Hose Clamp Replacement Guidelines - Spring Type
5. Connect Electrical Connector (1)

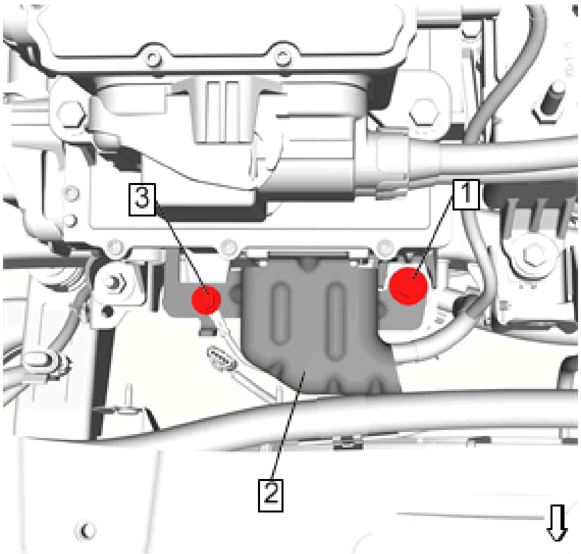

Fig. 162: Drive Motor Power Inverter Module Shield And Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Install Drive Motor Power Inverter Module Shield (2)

CAUTION: **Refer to Fastener Caution**

7. Install and tighten Ground Cable Bolt (3) @ Drive Motor Power Inverter Module to 9 N.m (80 lb in)
8. Install and tighten Drive Motor Power Inverter Module Shield Bolt (1) to 25 N.m (18 lb ft)

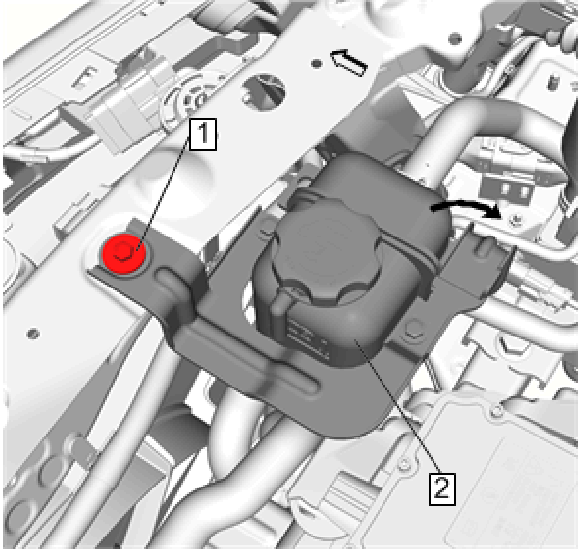

Fig. 163: Drive Motor Battery Radiator Surge Tank And Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

9. Install Drive Motor Battery Radiator Surge Tank (2)
10. Install and tighten Drive Motor Battery Radiator Surge Tank Bracket Bolt (1) to 9 N.m (80 lb in)
11. Install Front Compartment Front Sight Shield. Refer to **Front Compartment Front Sight Shield Replacement**
12. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
13. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection**

RADIATOR AIR LOWER BAFFLE AND DEFLECTOR REPLACEMENT

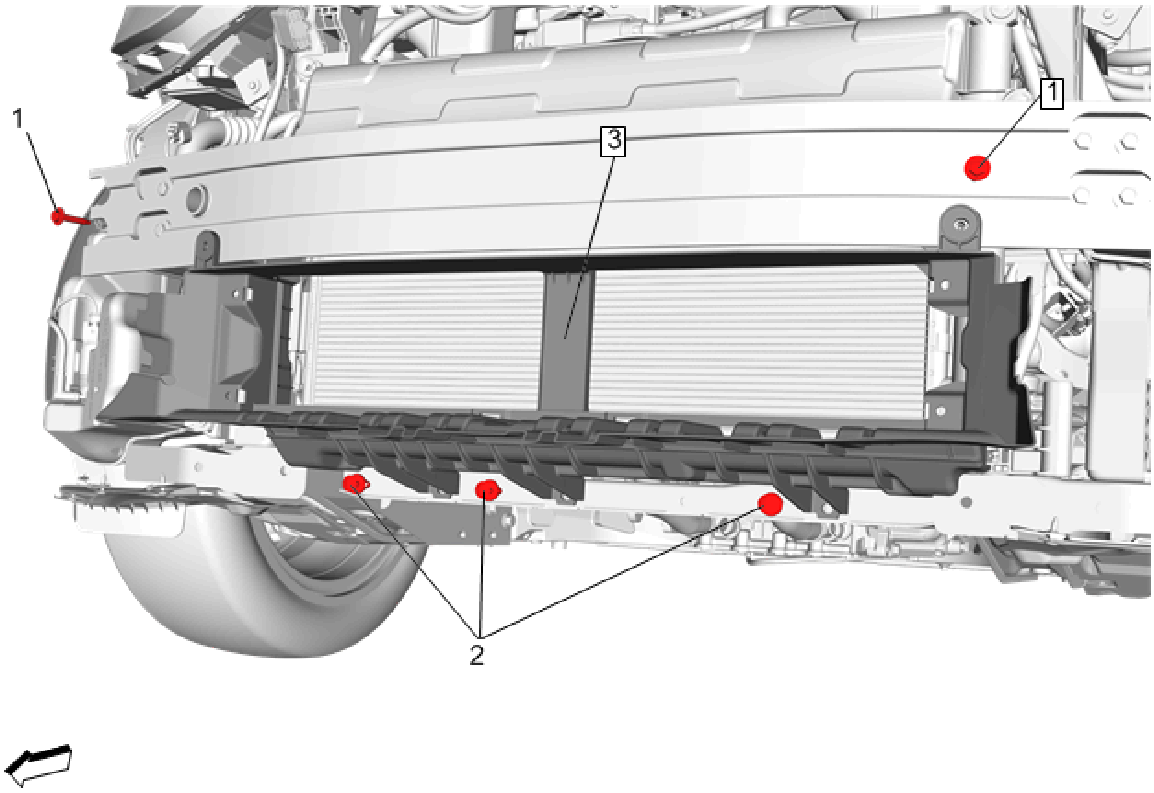

Fig. 164: Radiator Air Lower Baffle and Deflector Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Bumper Shutter. Refer to **Front Bumper Shutter Replacement**	

Callout	Component Name
1	Radiator Air Lower Baffle Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** 9 N.m (80 lb in)
2	Radiator Air Lower Baffle Retainer (Qty: 3)
3	Radiator Air Lower Baffle and Deflector Assembly **Procedure** Unclip the electrical harness.

RADIATOR AIR UPPER BAFFLE AND DEFLECTOR REPLACEMENT

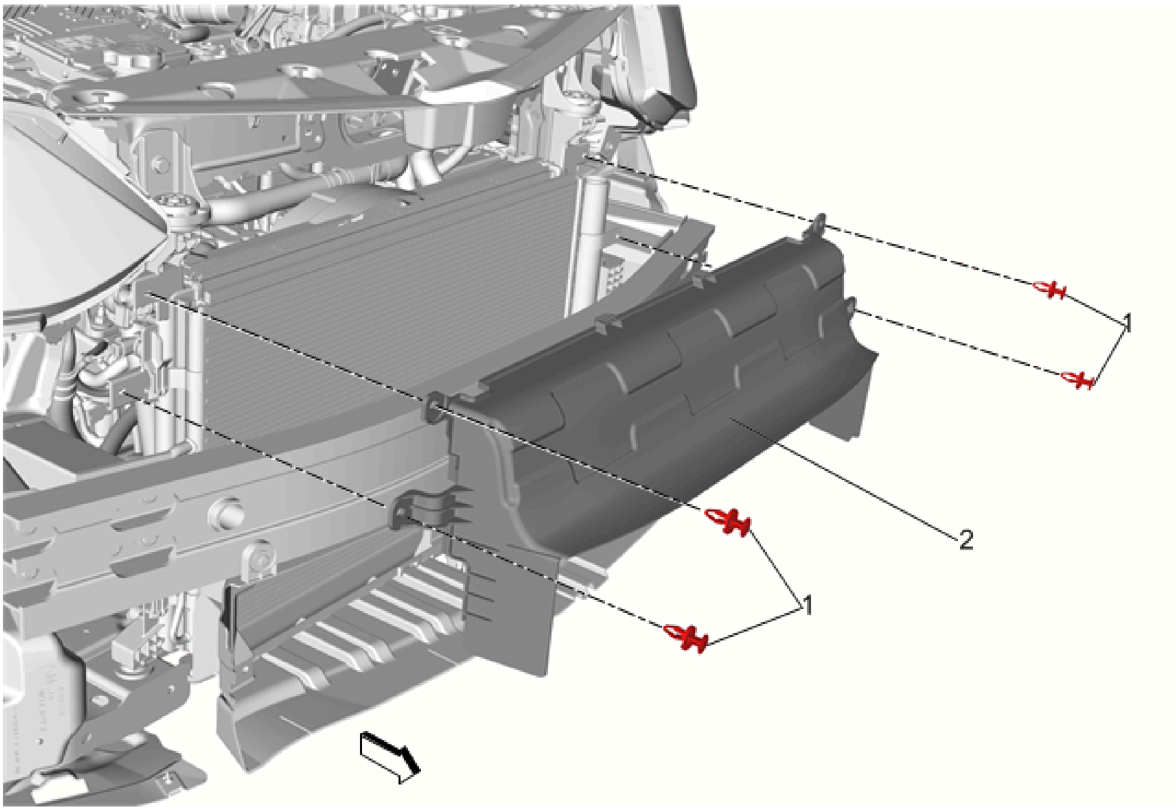

Fig. 165: Radiator Air Upper Baffle And Deflector
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Bumper Fascia. Refer to Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)	
1	Radiator Air Upper Baffle Retainer (Qty: 4)
2	Radiator Air Upper Baffle and Deflector

HIGH VOLTAGE BATTERY HEATER REPLACEMENT

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**

- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. Refer to **High Voltage Disabling**
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
3. Drain the drive motor battery cooling system. Refer to **Drive Motor Battery Cooling System Draining and Filling**

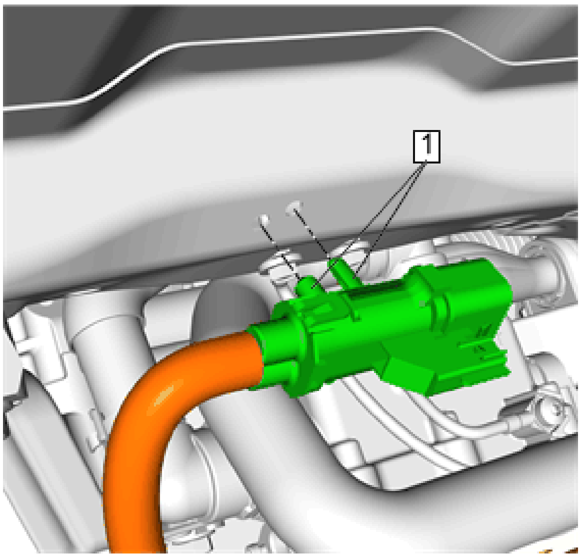

Fig. 166: Retainer
Courtesy of GENERAL MOTORS COMPANY

4. Unclip Retainer (1)

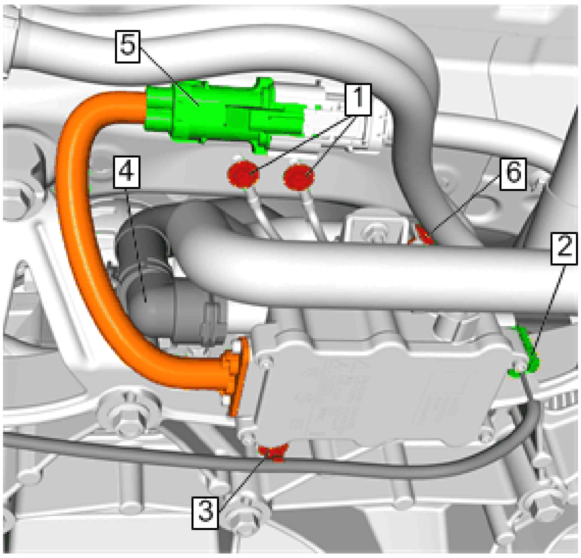

Fig. 167: Drive Motor Battery Coolant Cooler Inlet Hose, Electrical Connectors, Retainers And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect Electrical Connectors (2, 5)
6. Remove Retainers (3, 6)
7. Remove Ground Cable Bolts (1) (Qty: 2)
8. Remove Drive Motor Battery Coolant Cooler Inlet Hose (4) @ High Voltage Battery Heater. Refer to **Drive Motor Battery Coolant Cooler Inlet Hose Replacement (Pump To RESS Heater)**

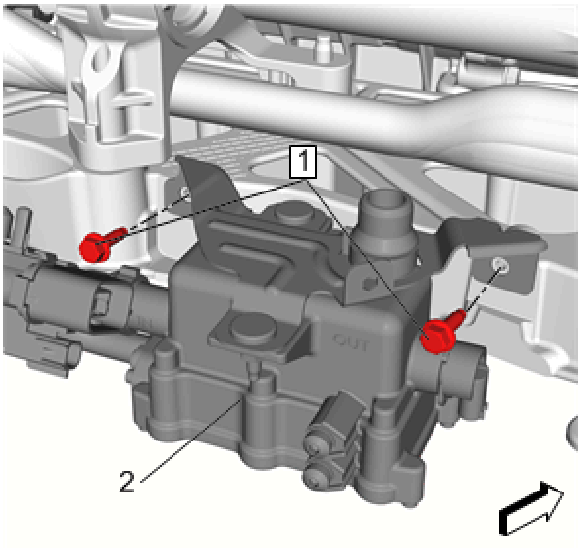

Fig. 168: High Voltage Battery Heater And Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Remove Heater Bracket Bolts (1) (Qty: 2)
10. Lower the high voltage battery heater (2) to get the space to access to the battery vent hose.
11. Remove Battery Vent Hose @ High Voltage Battery Heater (2). Refer to **Battery Vent Hose Replacement (RESS HTR To RESS)**
12. Remove High Voltage Battery Heater (2)

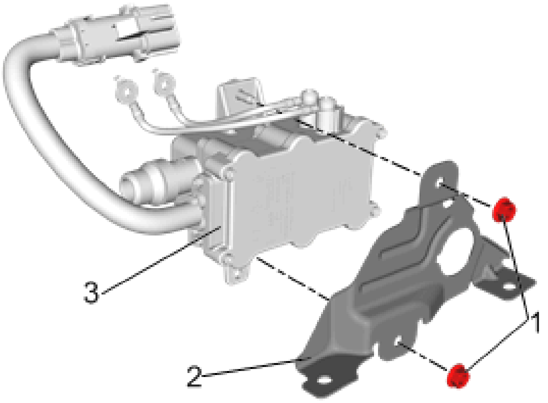

Fig. 169: High Voltage Battery Heater, Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

13. Remove the 2 heater bracket nuts (1).
14. Remove Heater Bracket (2) @ High Voltage Battery Heater (3)

Installation Procedure

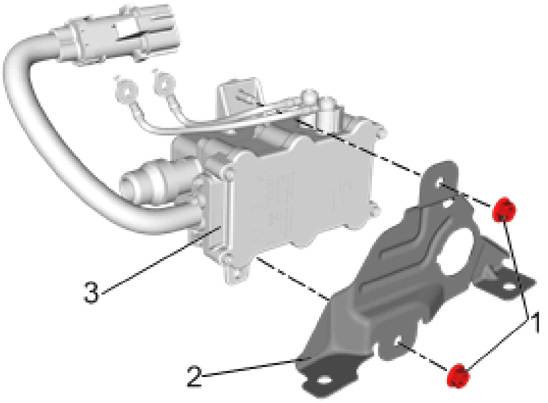

Fig. 170: High Voltage Battery Heater, Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Install Heater Bracket (2) @ High Voltage Battery Heater (3)

CAUTION: **Refer to Fastener Caution .**

2. Install the 2 heater bracket nuts (1) and tighten to 9 N.m (80 lb in)

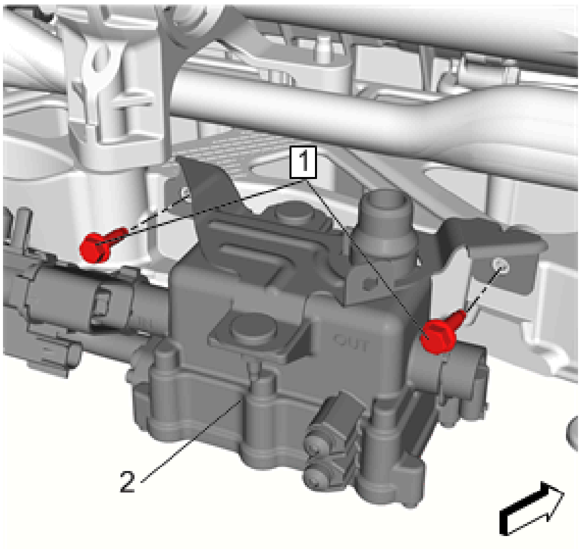

Fig. 171: High Voltage Battery Heater And Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install High Voltage Battery Heater (2)
4. Install Battery Vent Hose @ High Voltage Battery Heater (2). Refer to Battery Vent Hose Replacement (RESS HTR To RESS)
5. Install and tighten Heater Bracket Bolts (1) (Qty: 2) to 9 N.m (80 lb in)

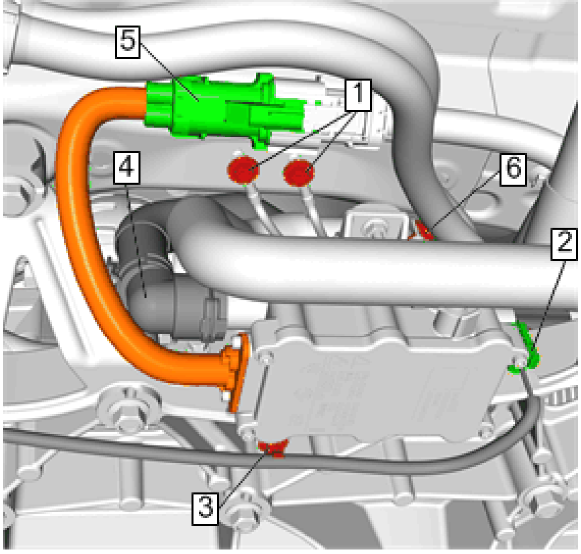

Fig. 172: Drive Motor Battery Coolant Cooler Inlet Hose, Electrical Connectors, Retainers And Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Install Drive Motor Battery Coolant Cooler Inlet Hose (4) @ High Voltage Battery Heater. Refer to Drive Motor Battery Coolant Cooler Inlet Hose Replacement (Pump To RESS Heater)
7. Install and tighten Ground Cable Bolt (1) (Qty: 2) to 9 N.m (80 lb in)
8. Install Retainers (3, 6)
9. Connect Electrical Connectors (2, 5)

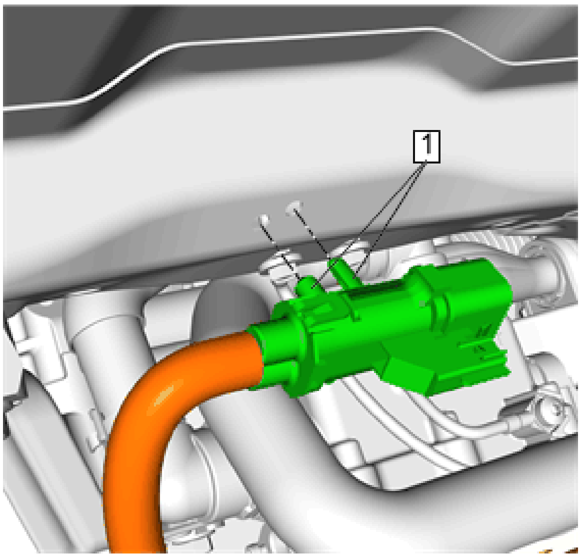

Fig. 173: Retainer
Courtesy of GENERAL MOTORS COMPANY

10. Install Retainer (1)
11. Fill the drive motor generator power inverter module cooling system. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling
12. Check the cooling system for leaks.
13. Enable the high voltage system. Refer to High Voltage Enabling

DRIVE MOTOR POWER INVERTER MODULE COOLING INLET HOSE REPLACEMENT (OBCM TO DU)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**

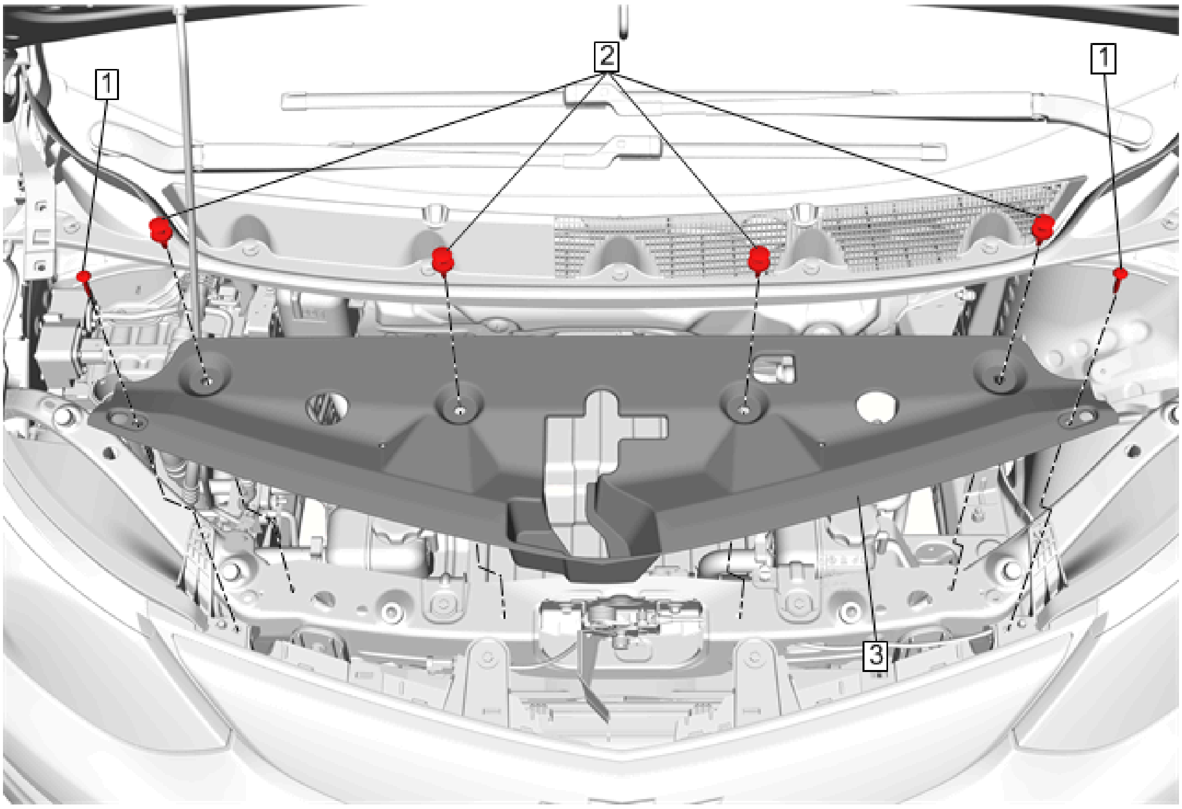

Fig. 174: Front Compartment Front Sight Shield
Courtesy of GENERAL MOTORS COMPANY

3. Remove Front Compartment Front Sight Shield (3). Refer to **Front Compartment Front Sight Shield Replacement**

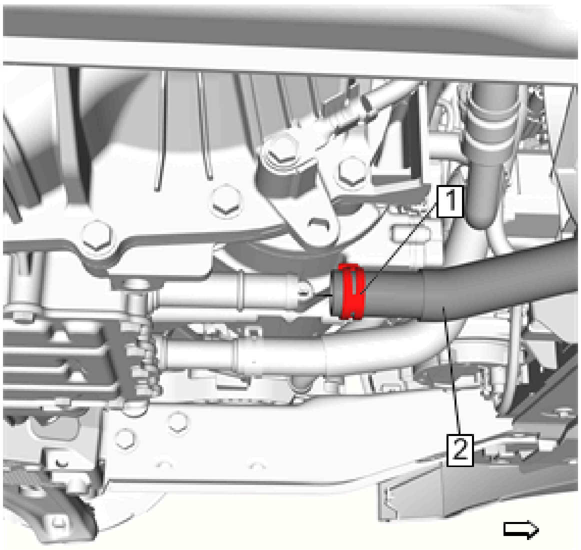

Fig. 175: Drive Motor Power Inverter Module Cooling Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
5. Remove the drive motor power inverter module cooling inlet hose (2) from the drive unit (DU).

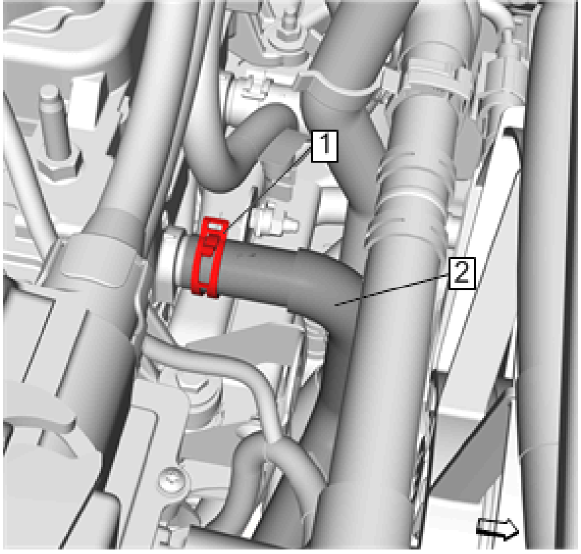

Fig. 176: Drive Motor Power Inverter Module Cooling Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

6. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
7. Remove the drive motor power inverter module cooling inlet hose (2) from the on board charging module (OBCM).

Installation Procedure

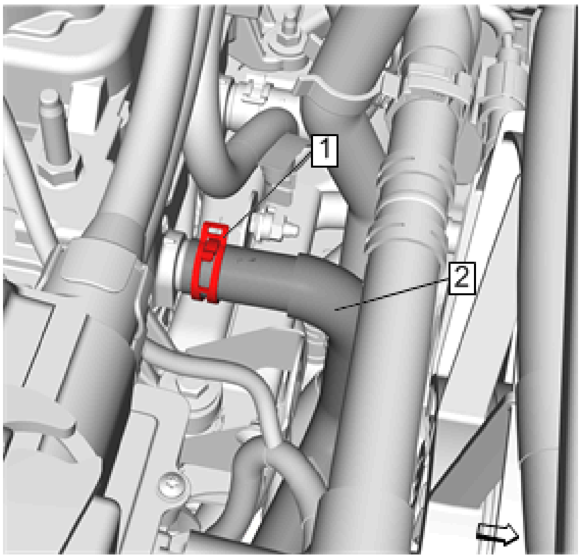

Fig. 177: Drive Motor Power Inverter Module Cooling Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install the drive motor power inverter module cooling inlet hose (2) to the on board charging module (OBCM).
2. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**

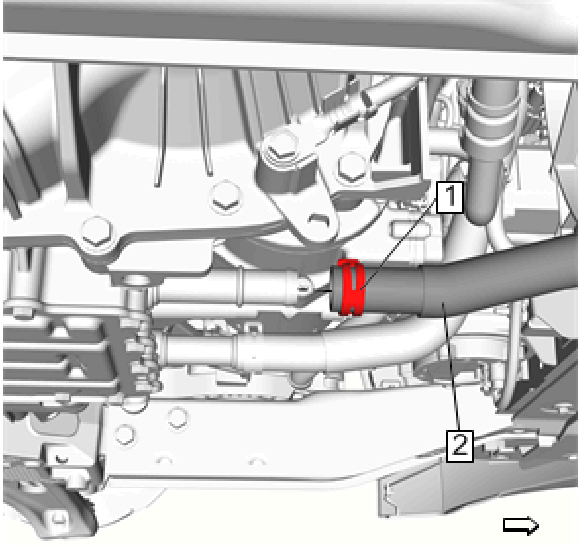

Fig. 178: Drive Motor Power Inverter Module Cooling Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

3. Install the drive motor power inverter module cooling inlet hose (2) to the drive unit (DU).
4. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**

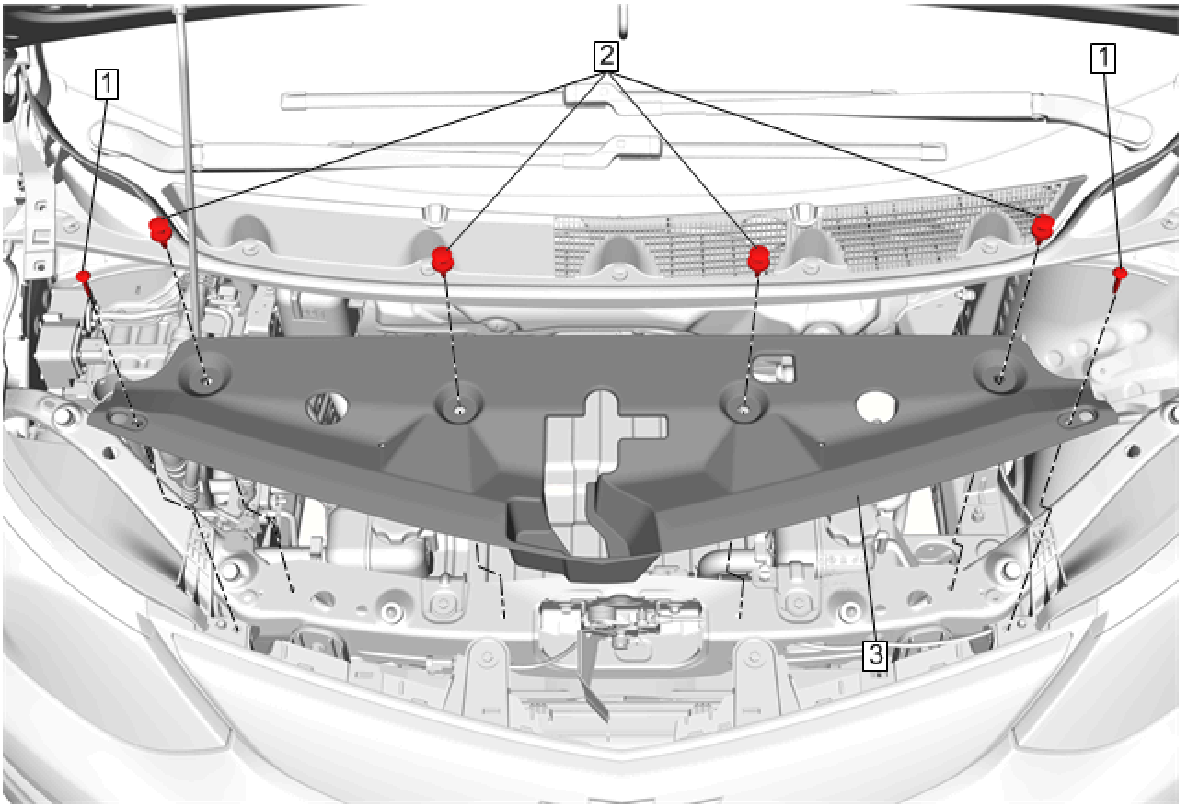

Fig. 179: Front Compartment Front Sight Shield
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Compartment Front Sight Shield (3). Refer to **Front Compartment Front Sight Shield Replacement**
6. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
7. Check the cooling system for leaks.

DRIVE MOTOR BATTERY COOLANT COOLER REPLACEMENT

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any**

cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain the drive motor battery cooling system draining and filling. Refer to **Drive Motor Battery Cooling System Draining and Filling**
3. Remove Air Conditioning Evaporator Hose Assembly @ Drive Motor Battery Coolant Cooler. Refer to **Air Conditioning Evaporator Hose Assembly Replacement**

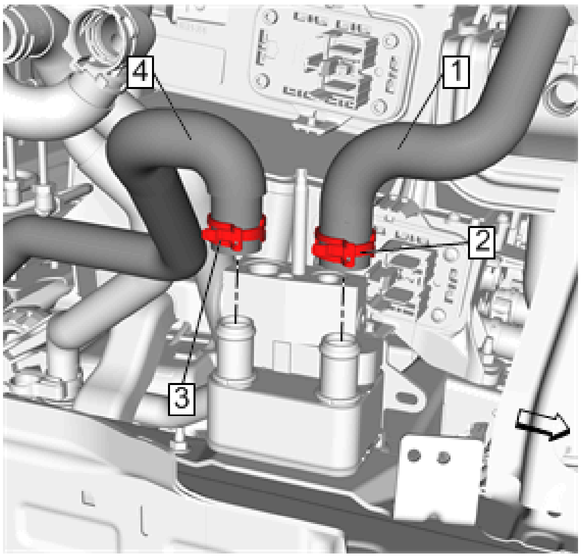

Fig. 180: Drive Motor Battery Coolant Cooler Outlet Hose, Drive Motor Battery Radiator Outlet Hose And Clamps
Courtesy of GENERAL MOTORS COMPANY

4. Disengage Clamp (2). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
5. Remove the drive motor battery radiator outlet hose (1).
6. Disengage Clamp (3). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
7. Remove Drive Motor Battery Coolant Cooler Outlet Hose (4)

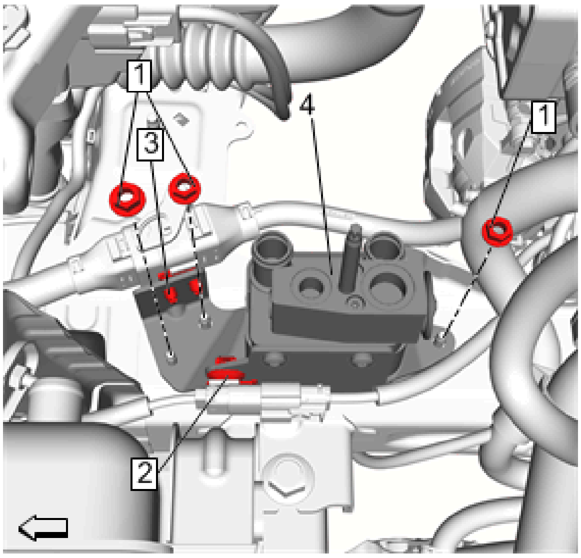

Fig. 181: Drive Motor Battery Coolant Cooler, Bracket Nuts And Retainers
Courtesy of GENERAL MOTORS COMPANY

8. Remove Drive Motor Battery Coolant Cooler Bracket Nuts (1) (Qty: 3)
9. Remove Retainers (2, 3)
10. Remove Drive Motor Battery Coolant Cooler (4)

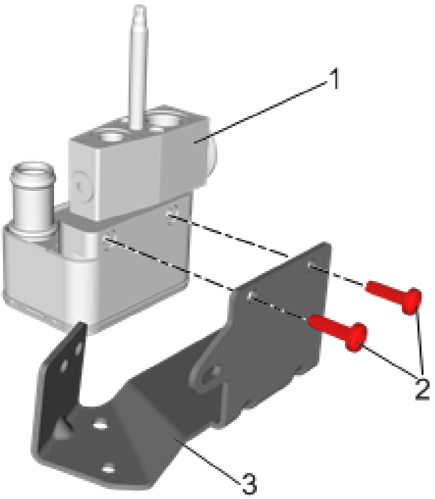

Fig. 182: Drive Motor Battery Coolant Cooler, Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

11. Remove the 2 drive motor battery coolant cooler bracket bolts (2).
12. Remove Drive Motor Battery Coolant Cooler Bracket (3) @ Drive Motor Battery Coolant Cooler (1)

Installation Procedure

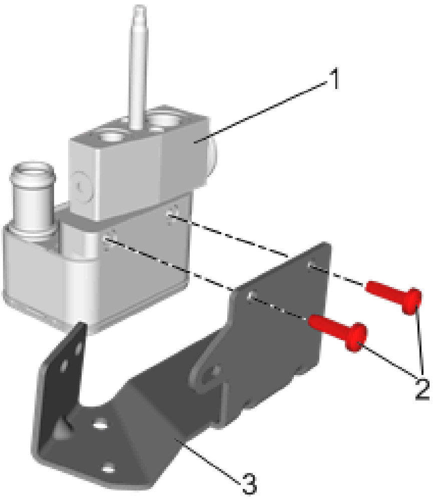

Fig. 183: Drive Motor Battery Coolant Cooler, Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Battery Coolant Cooler Bracket (3) @ Drive Motor Battery Coolant Cooler (1)

CAUTION: **Refer to Fastener Caution .**

2. Install the 2 drive motor battery coolant cooler bracket bolts (2) and tighten to 9 N.m (80 lb in).

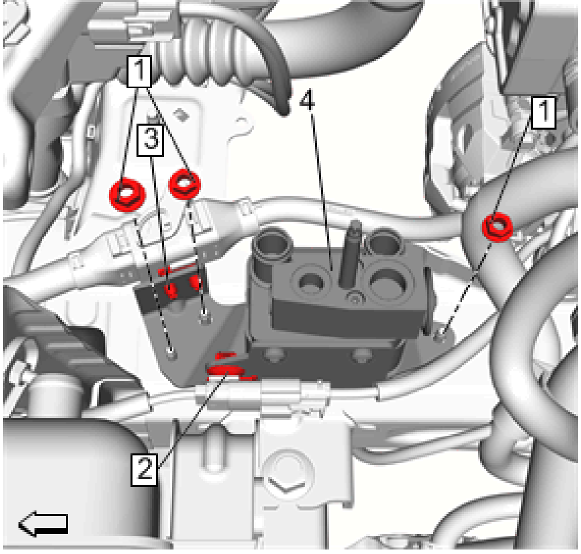

Fig. 184: Drive Motor Battery Coolant Cooler, Bracket Nuts And Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Install Drive Motor Battery Coolant Cooler (4)
4. Install Retainers (2, 3)
5. Install and tighten Drive Motor Battery Coolant Cooler Bracket Nuts (1) (Qty: 3) to 9 N.m (80 lb in)

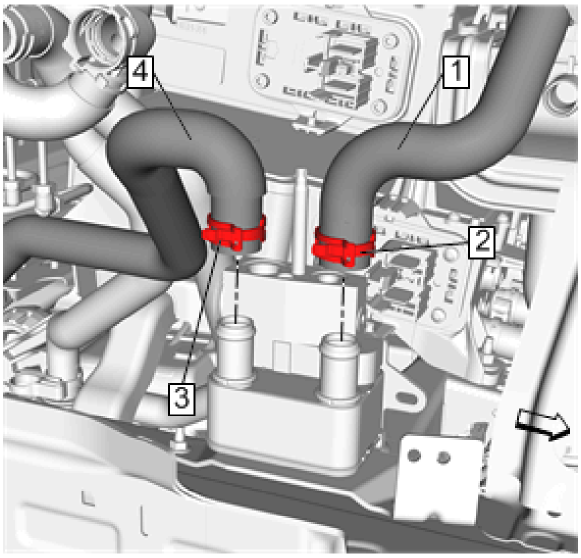

Fig. 185: Drive Motor Battery Coolant Cooler Outlet Hose, Drive Motor Battery Radiator Outlet Hose And Clamps
Courtesy of GENERAL MOTORS COMPANY

6. Install Drive Motor Battery Coolant Cooler Outlet Hose (4)
7. Engage Clamp (3). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
8. Install the drive motor battery radiator outlet hose (1).
9. Engage Clamp (2). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
10. Install Air Conditioning Evaporator Hose Assembly @ Drive Motor Battery Coolant Cooler. Refer to **Air Conditioning Evaporator Hose Assembly Replacement**
11. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
12. Check the cooling system for leaks.

DRIVE MOTOR BATTERY COOLANT PUMP REPLACEMENT (RESS PUMP)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any**

cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection

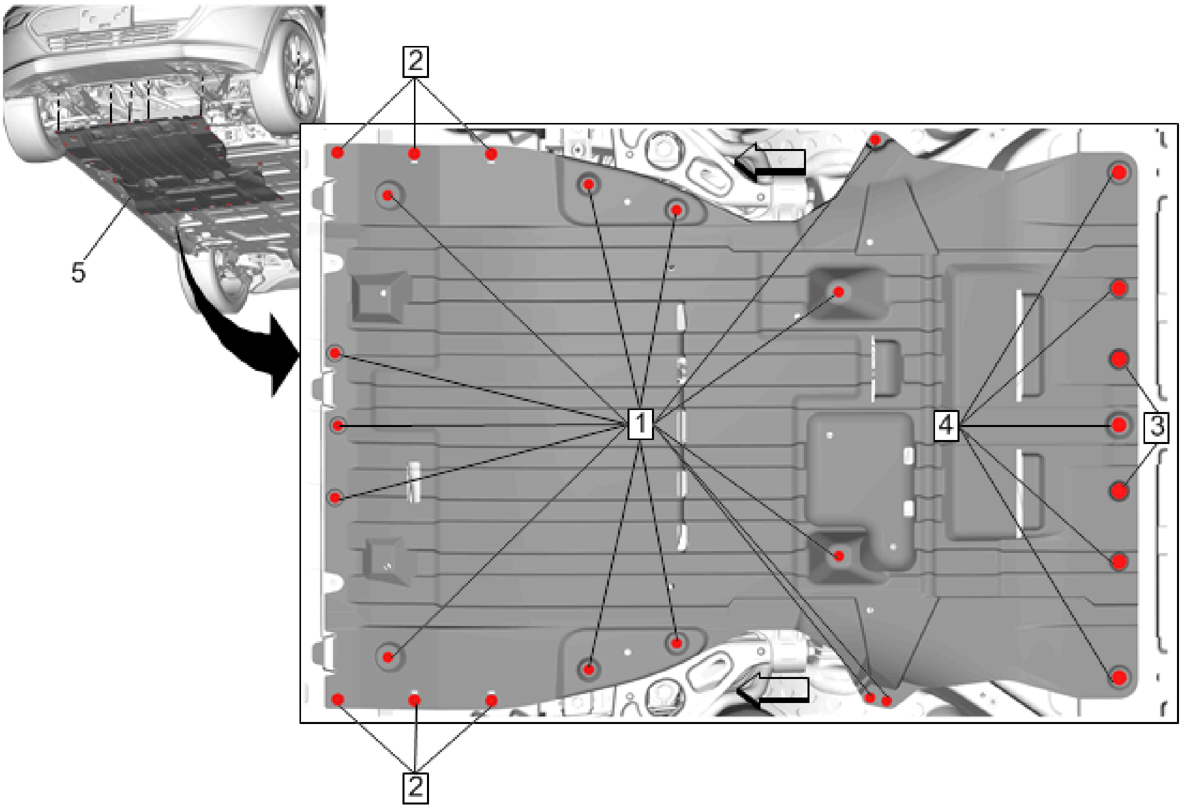

Fig. 186: Front Compartment Air Deflector And Fasteners
Courtesy of GENERAL MOTORS COMPANY

3. Remove Front Compartment Air Deflector (5). Refer to Front Compartment Air Deflector Replacement
4. Drain the drive motor generator power inverter module cooling system. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling

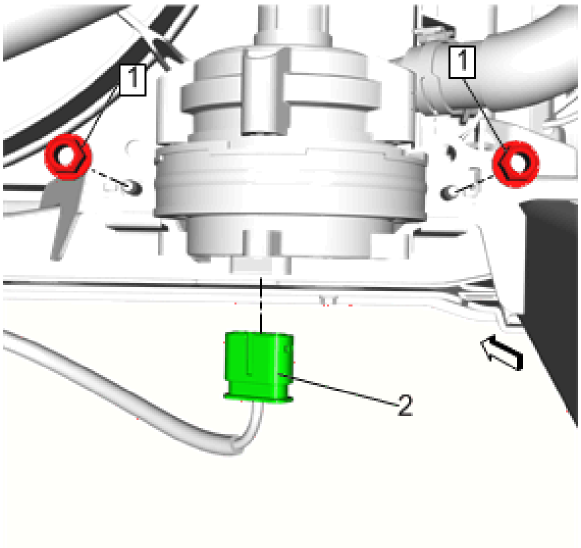

Fig. 187: Drive Motor Battery Coolant Pump Bracket Nuts And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect Electrical Connector (2)
6. Remove the 2 drive motor battery coolant pump bracket nuts (1).

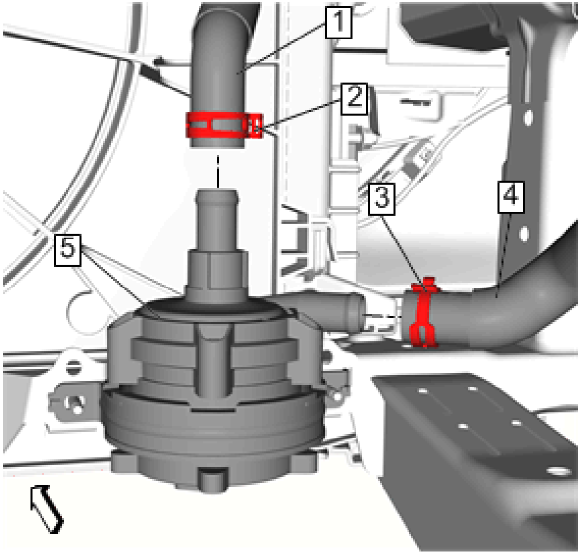

Fig. 188: Drive Motor Battery Coolant Pump And Attaching Components
Courtesy of GENERAL MOTORS COMPANY

7. Disengage Clamp (2). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
8. Remove Drive Motor Battery Coolant Pump Inlet Hose (1) @ Drive Motor Battery Coolant Pump (5)
9. Disengage Clamp (3). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
10. Remove Drive Motor Battery Coolant Cooler Inlet Hose (4) @ Drive Motor Battery Coolant Pump (5)
11. Remove Drive Motor Battery Coolant Pump (5)

Installation Procedure

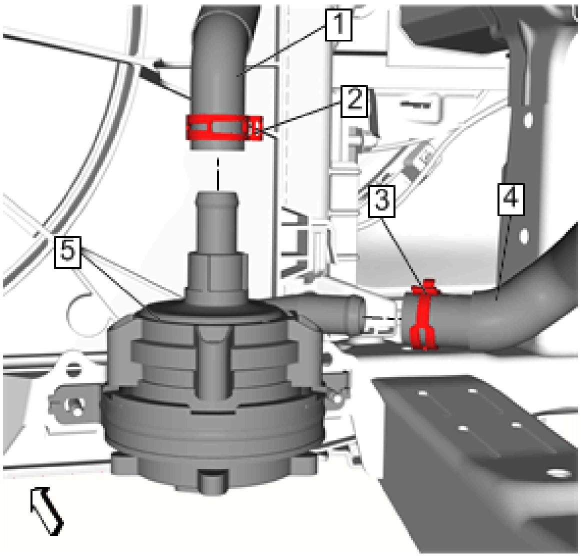

Fig. 189: Drive Motor Battery Coolant Pump And Attaching Components
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Battery Coolant Pump (5)
2. Install Drive Motor Battery Coolant Cooler Inlet Hose (4) @ Drive Motor Battery Coolant Pump (5)
3. Engage Clamp (3). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
4. Install Drive Motor Battery Coolant Pump Inlet Hose (1) @ Drive Motor Battery Coolant Pump (5)
5. Engage Clamp (2). Refer to **Hose Clamp Replacement Guidelines - Spring Type**

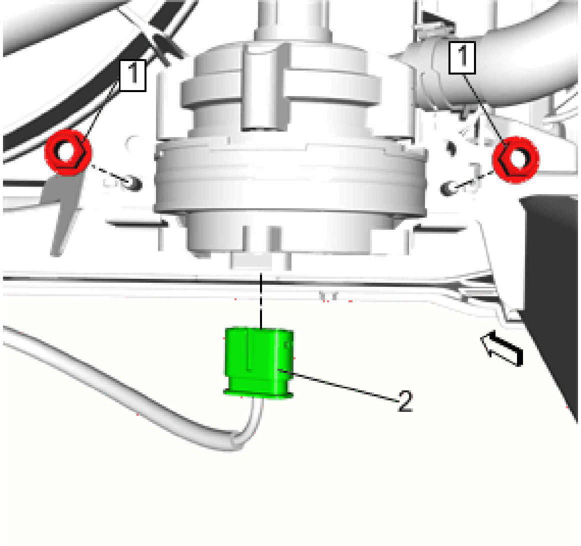

Fig. 190: Drive Motor Battery Coolant Pump Bracket Nuts And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution**

6. Install the 2 drive motor battery coolant pump bracket nuts (1) and tighten to 9 N.m (80 lb in).
7. Connect Electrical Connector (2)

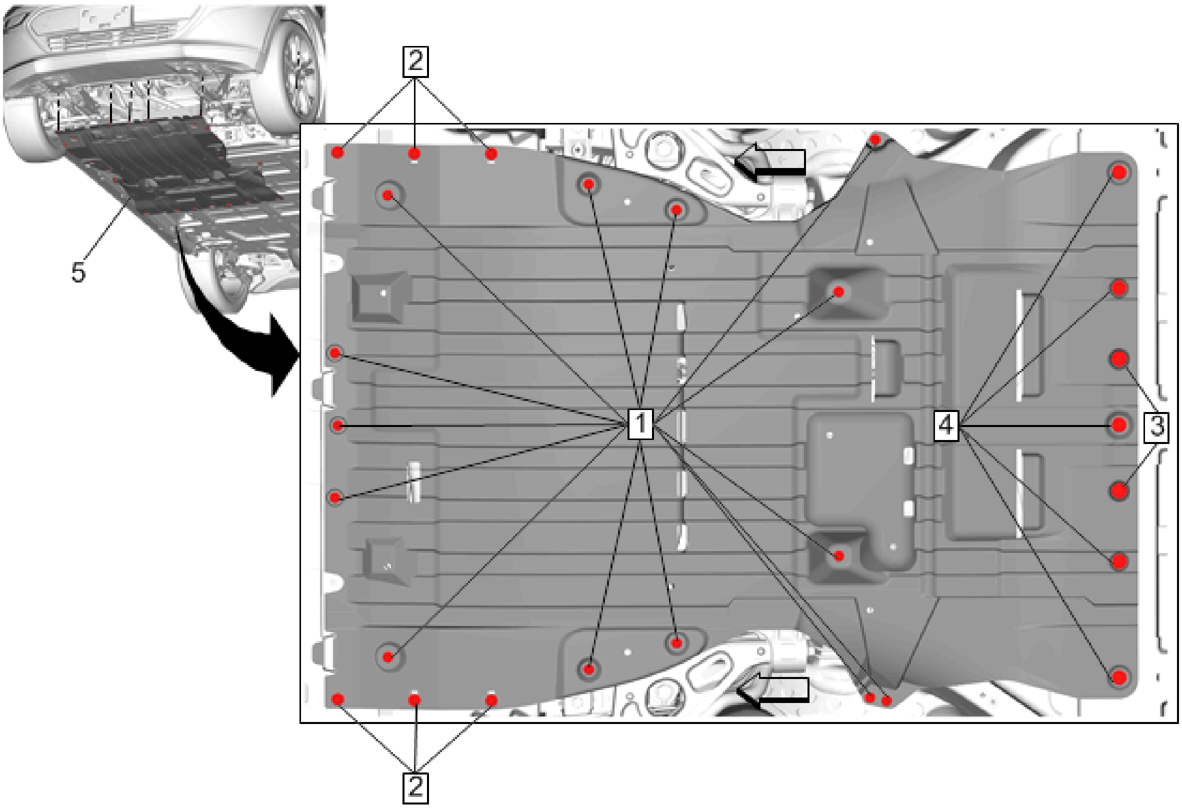

Fig. 191: Front Compartment Air Deflector And Fasteners
Courtesy of GENERAL MOTORS COMPANY

8. Install Front Compartment Air Deflector (5). Refer to **Front Compartment Air Deflector Replacement**
9. Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
10. Check the cooling system for leaks.
11. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection**

DRIVE MOTOR BATTERY COOLANT PUMP REPLACEMENT (PE PUMP)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults**

exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection

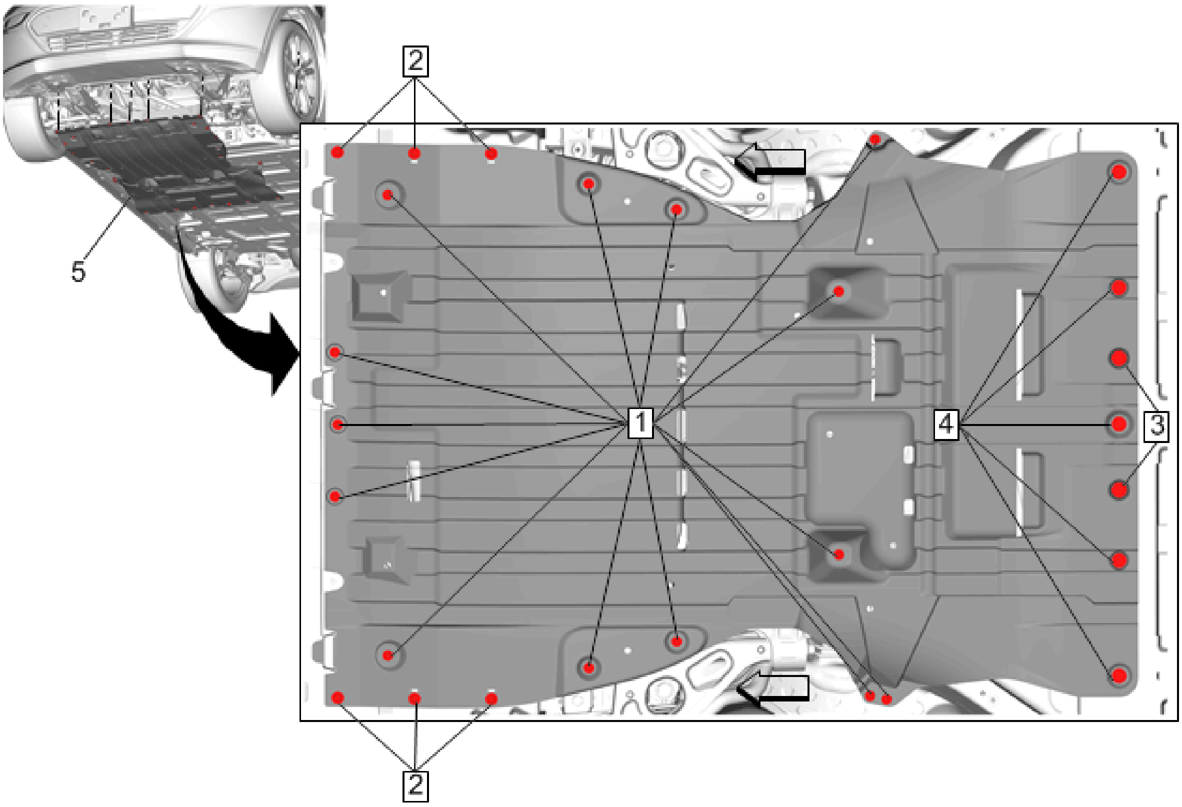

Fig. 192: Front Compartment Air Deflector And Fasteners
Courtesy of GENERAL MOTORS COMPANY

3. Remove Front Compartment Air Deflector (5). Refer to Front Compartment Air Deflector Replacement
4. Drain the drive motor generator power inverter module cooling system. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling

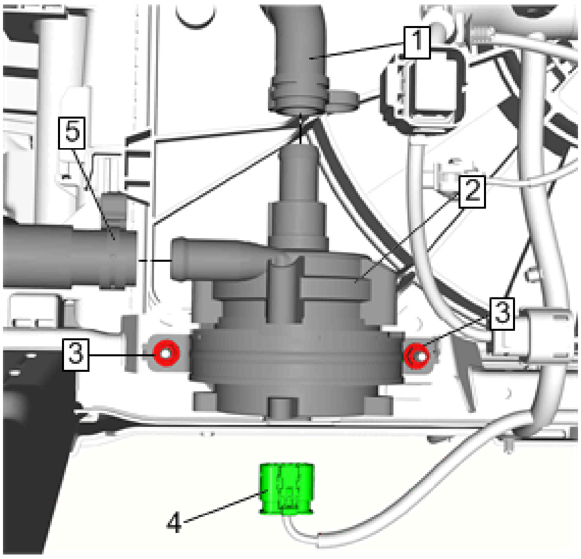

Fig. 193: Drive Motor Battery Coolant Pump And Attaching Components
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect Electrical Connector (4) @ Drive Motor Battery Coolant Pump (2)
6. Disengage Drive Motor Generator Control Module Coolant Pump Hose (1) @ Drive Motor Battery Coolant Pump (2). Refer to Hose Clamp Replacement Guidelines - Spring Type
7. Remove Drive Motor Battery Coolant Pump (2)

Installation Procedure

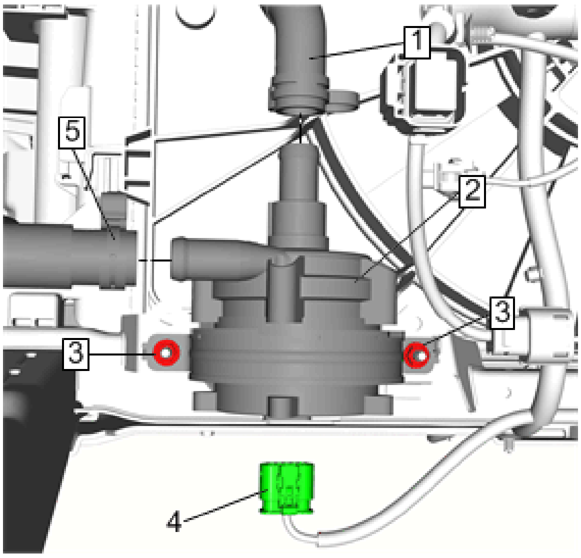

Fig. 194: Drive Motor Battery Coolant Pump And Attaching Components
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Battery Coolant Pump (2)
2. Engage Drive Motor Generator Control Module Coolant Pump Hose (1) @ Drive Motor Battery Coolant Pump (2). Refer to Hose Clamp Replacement Guidelines - Spring Type
3. Connect Electrical Connector (4) @ Drive Motor Battery Coolant Pump (2)

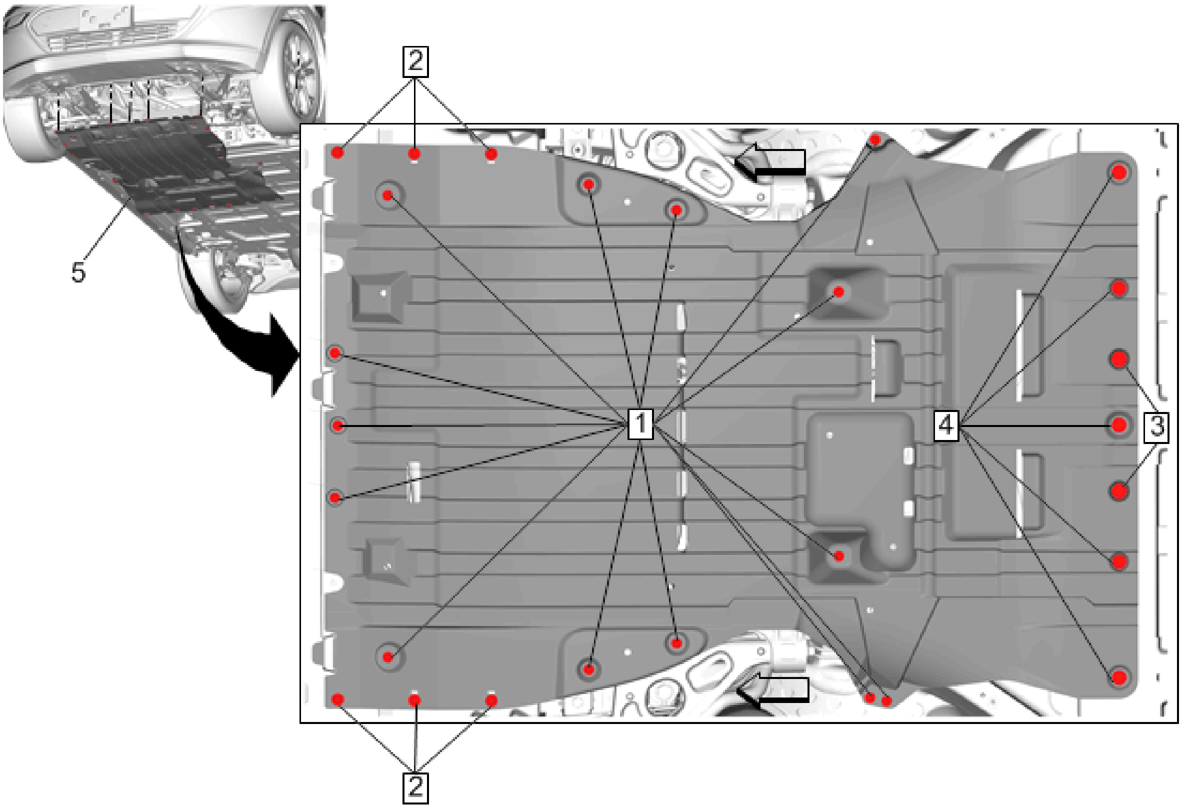

Fig. 195: Front Compartment Air Deflector And Fasteners
Courtesy of GENERAL MOTORS COMPANY

4. Install Front Compartment Air Deflector (5). Refer to Front Compartment Air Deflector Replacement
5. Fill the drive motor generator power inverter module cooling system. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling
6. Check the cooling system for leaks.
7. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection

DRIVE MOTOR BATTERY COOLANT PUMP INLET HOSE REPLACEMENT (SURGE TANK TO PUMP)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

5. Install Front Compartment Air Deflector (5). Refer to **Front Compartment Air Deflector Replacement**
6. Fill the drive motor battery cooling system. Refer to **Drive Motor Battery Cooling System Draining and Filling**
7. Check the cooling system for leaks.

DRIVE MOTOR BATTERY RADIATOR SURGE TANK REPLACEMENT

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection**
3. Drain the drive motor battery cooling system. Refer to **Drive Motor Battery Cooling System Draining and Filling**

7. Install Front Compartment Air Deflector (5). Refer to Front Compartment Air Deflector Replacement

8. Fill the drive motor battery cooling system. Refer to **Drive Motor Battery Cooling System Draining and Filling**
9. Check the cooling system for leaks.

DRIVE MOTOR BATTERY COOLANT INLET HOSE REPLACEMENT

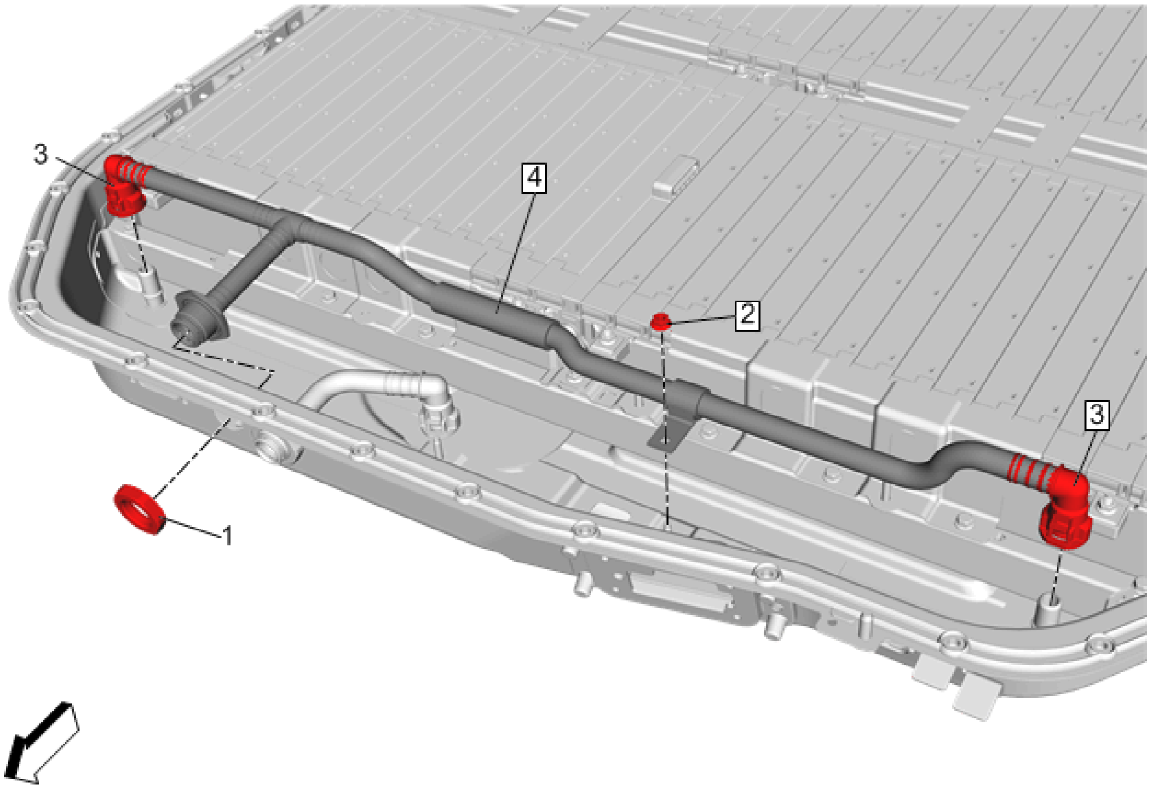

Fig. 222: Drive Motor Battery Coolant Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

WARNING:

Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING:

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

Preliminary Procedure

1. Remove the high voltage battery disconnect relay. Refer to **High Voltage Battery Disconnect Relay Replacement**
2. Remove the high voltage connector X4 harness assembly. Refer to **High Voltage Connector Replacement (X4)**

Callout	Component Name
1	Drive Motor Battery Coolant Port Nut **CAUTION:** **Refer to Fastener Caution** **Tighten** 40 N.m (30 lb ft) **NOTE:** **Use a suitable tool to hold the backside fastener (inside nut).**
2	Drive Motor Battery Coolant Inlet Hose Nut **Tighten** 5 N.m (44 lb in)
3	Drive Motor Battery Coolant Inlet Hose Quick Connectors (Qty: 2) **NOTE:** **Place rags around the quick connectors. Residual coolant will leak out when quick connectors are disconnected and under no circumstances can coolant leak into the battery tray.** **CAUTION:** **The module must be drained of all residual coolant prior to disassembly. Failure to properly drain all residual coolant may cause electronic circuit damage to occur during disassembly.**
4	Drive Motor Battery Coolant Inlet Hose **Procedure** Check the battery pack cooling system for leaks before installing the battery pack to the vehicle. Refer to **Hybrid Battery Pack Coolant Passage Leak Test**

DRIVE MOTOR BATTERY COOLANT OUTLET HOSE REPLACEMENT

7. Install Front Compartment Air Deflector (5). Refer to **Front Compartment Air Deflector Replacement**
8. Fill the drive motor battery cooling system. Refer to **Drive Motor Battery Cooling System Draining and Filling**
9. Check the cooling system for leaks.

BATTERY VENT HOSE REPLACEMENT (RESS HTR TO RESS)

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
3. Drain the drive motor battery cooling system. Refer to **Drive Motor Battery Cooling System Draining and Filling**

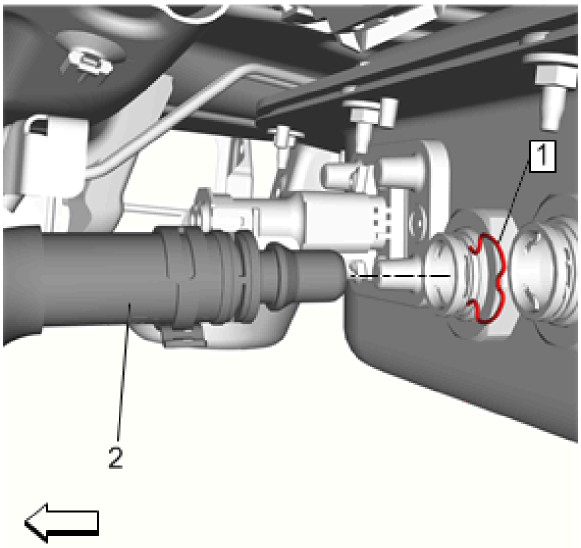

Fig. 233: Battery Vent Hose And Clip
Courtesy of GENERAL MOTORS COMPANY

4. Remove Clip (1)
5. Remove Battery Vent Hose (2)

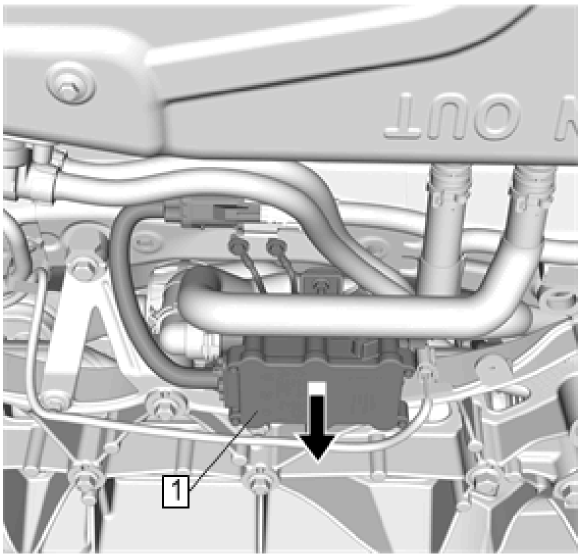

Fig. 234: High Voltage Battery Heater Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Lower the high voltage battery heater assembly (1) to get the space enough to access to the battery vent hose. Refer to High Voltage Battery Heater Replacement

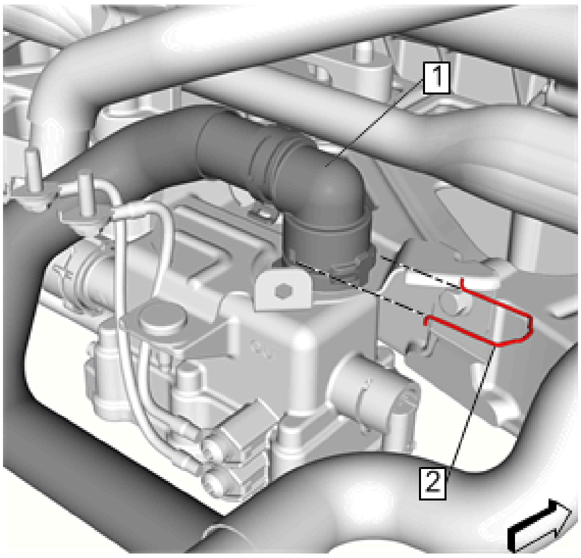

Fig. 235: Battery Vent Hose And Clip
Courtesy of GENERAL MOTORS COMPANY

7. Release Clip (2)
8. Remove Battery Vent Hose (1)

Installation Procedure

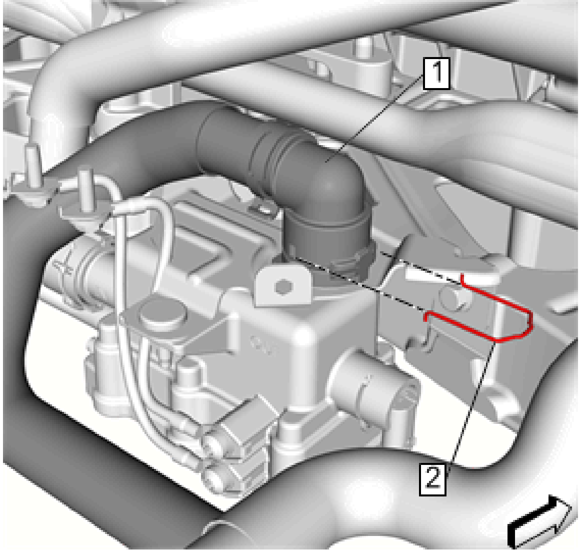

Fig. 236: Battery Vent Hose And Clip
Courtesy of GENERAL MOTORS COMPANY

1. Install Battery Vent Hose (1)
2. Install Clip (2)

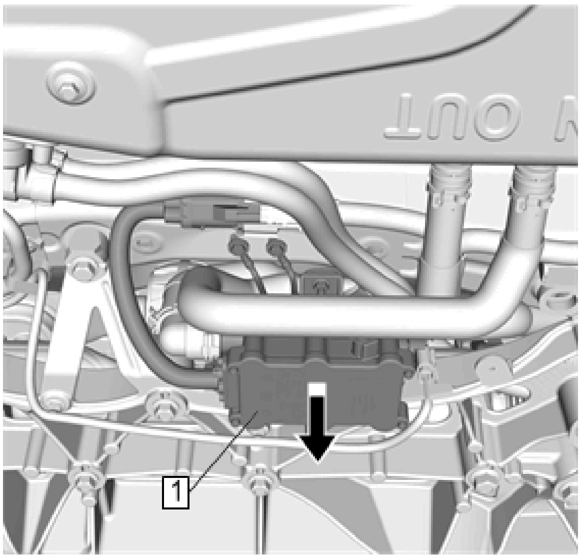

Fig. 237: High Voltage Battery Heater Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Install High Voltage Battery Heater (1). Refer to **High Voltage Battery Heater Replacement**

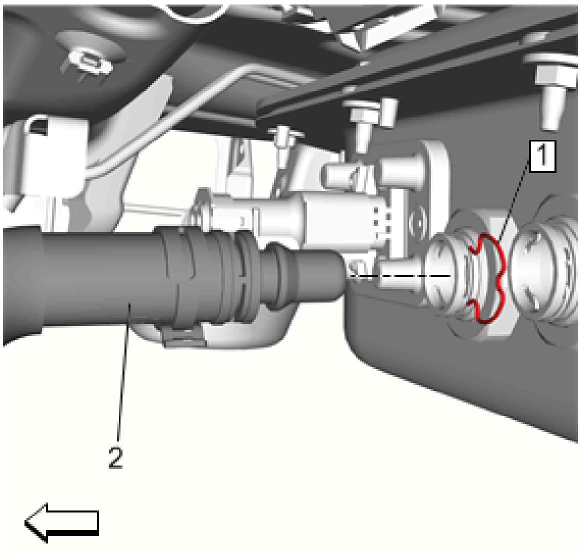

Fig. 238: Battery Vent Hose And Clip
Courtesy of GENERAL MOTORS COMPANY

4. Install Clip (1)

NOTE: **When installing the inlet or outlet hose, be careful not to confuse the inlet port and outlet port.**

5. Install Battery Vent Hose (2)
6. Fill the drive motor battery cooling system. Refer to **Drive Motor Battery Cooling System Draining and Filling**
7. Check the cooling system for leaks.

HEATER COOLANT SURGE TANK REPLACEMENT

Removal Procedure

WARNING: **Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.**

1. Turn vehicle power OFF and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain the heater coolant heater system. Refer to **Heater Coolant Heater Draining and Filling**

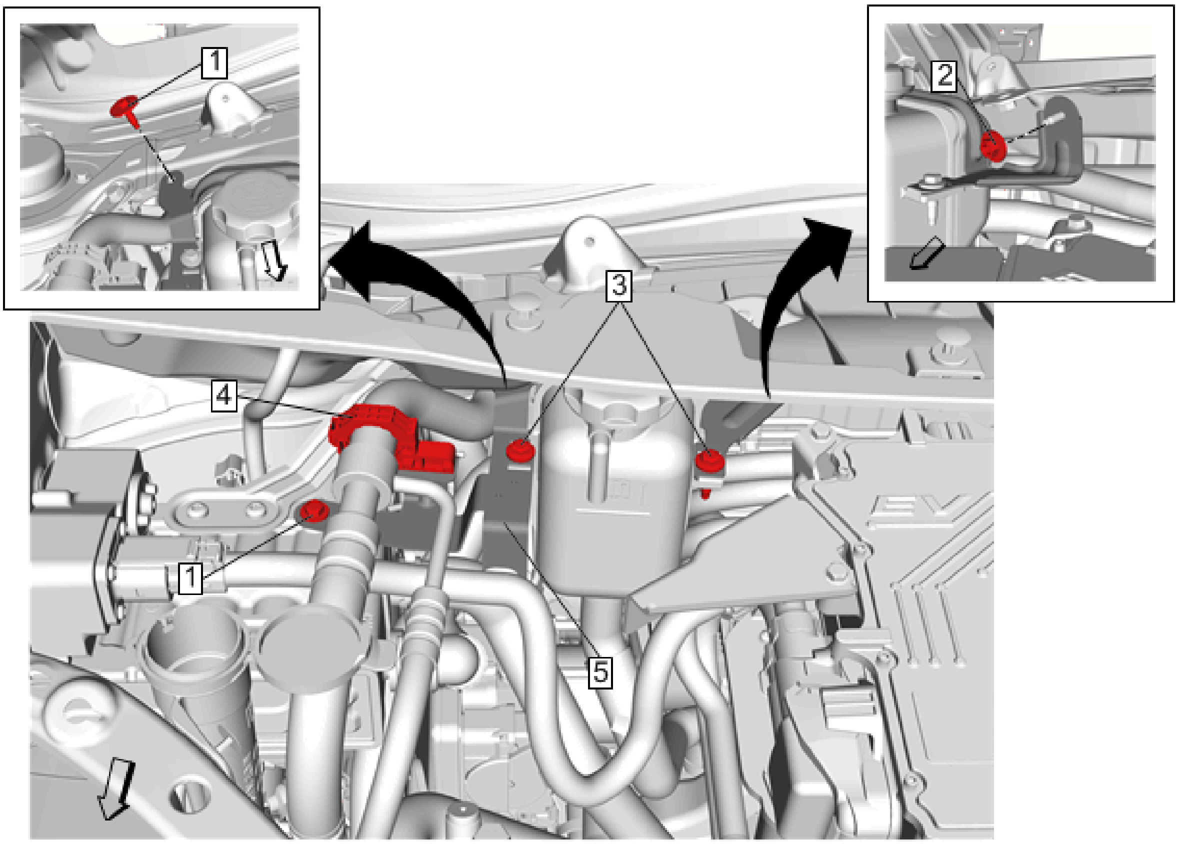

Fig. 239: Radiator Surge Tank Bracket-Heater Bracket
Courtesy of GENERAL MOTORS COMPANY

3. Remove Radiator Surge Tank Bracket-Heater Bracket (4). Refer to **Radiator Surge Tank Support Bracket Replacement (Heater)**

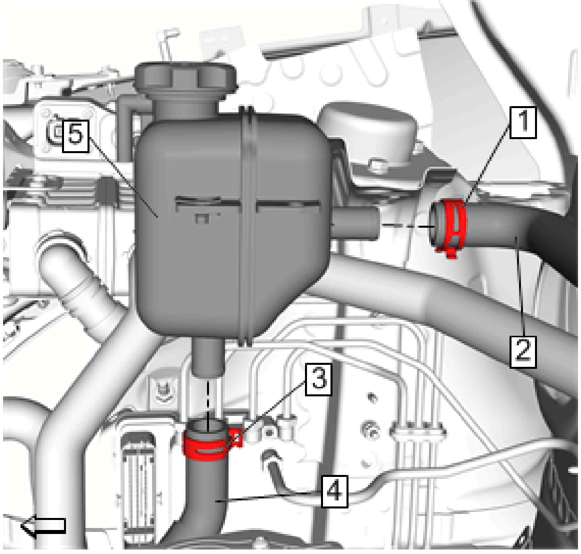

Fig. 240: Heater Coolant Surge Tank And Attaching Components
Courtesy of GENERAL MOTORS COMPANY

4. Disengage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
5. Remove Heater Inlet Hose (2)
6. Disengage Clamp (3). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
7. Remove Auxiliary Heater Inlet Hose (4)
8. Remove the heater coolant surge tank (5).
9. Transfer components as necessary.

Installation Procedure

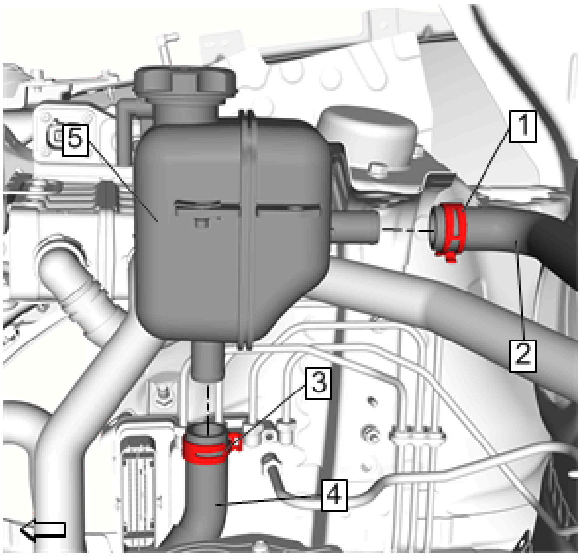

Fig. 241: Heater Coolant Surge Tank And Attaching Components
Courtesy of GENERAL MOTORS COMPANY

1. Install the heater coolant surge tank (5).
2. Auxiliary Heater Inlet Hose (4)
3. Engage Clamp (3). Refer to **Hose Clamp Replacement Guidelines - Spring Type**
4. Install Heater Inlet Hose (2)
5. Engage Clamp (1). Refer to **Hose Clamp Replacement Guidelines - Spring Type**

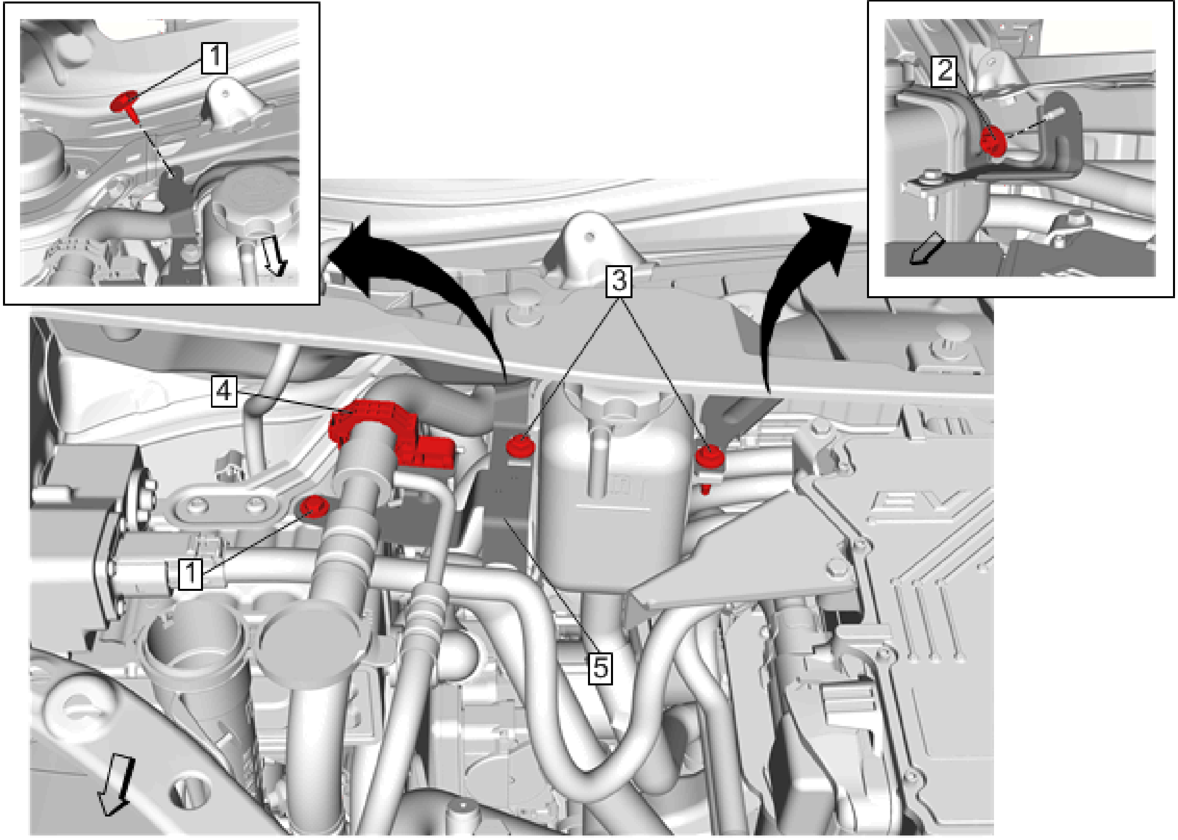

Fig. 242: Radiator Surge Tank Bracket-Heater Bracket
Courtesy of GENERAL MOTORS COMPANY

6. Install Radiator Surge Tank Bracket-Heater Bracket (4). Refer to **Radiator Surge Tank Support Bracket Replacement (Heater)**
7. Fill the heater coolant heater system. Refer to **Heater Coolant Heater Draining and Filling**
8. Check the cooling system for leaks.

DESCRIPTION AND OPERATION

HYBRID/EV COOLING SYSTEM DESCRIPTION AND OPERATION

This vehicle is equipped with three fully independent cooling systems.

1. The hybrid/EV electronics cooling system is dedicated to cooling the power electronics components.
2. The hybrid/EV battery pack cooling system is dedicated to cooling and heating the high voltage hybrid/EV battery.
3. The passenger compartment heater system is dedicated to providing heat to the passenger compartment.

Hybrid Electronics Cooling System Description and Operation

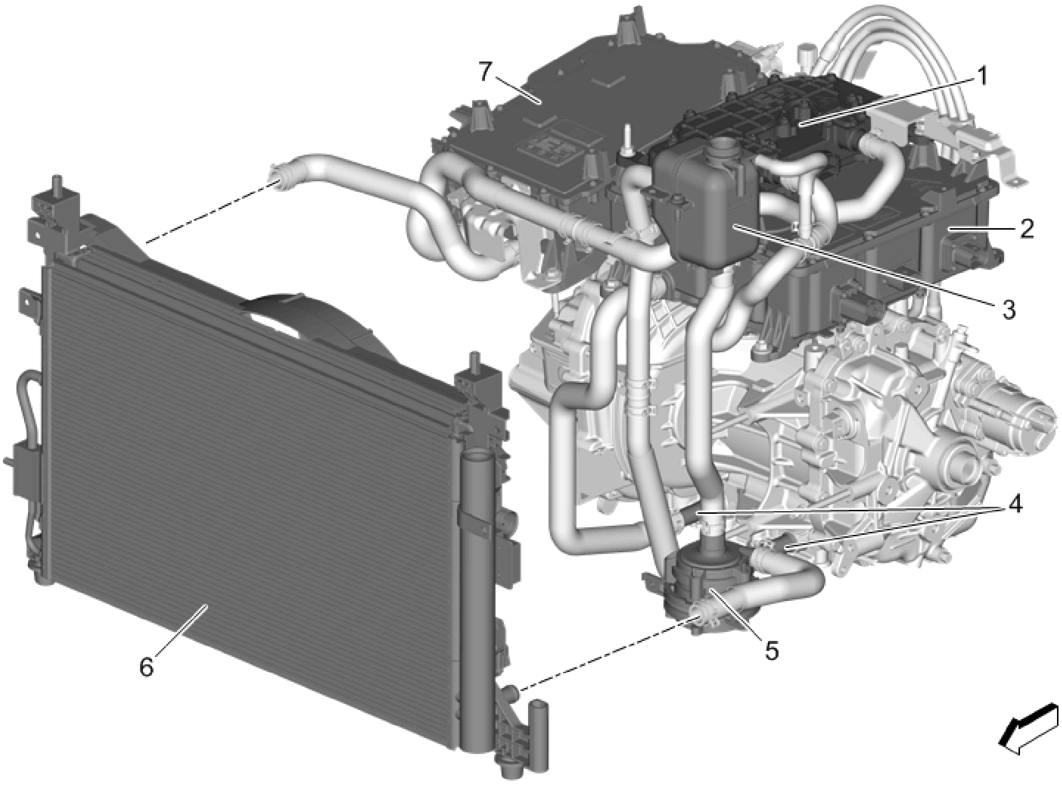

Fig. 243: Hybrid Electronics Cooling System Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Schematic Reference or Generic Name	Scan Tool Reference	Service Information Part Name or Electronic Part Catalog Name
1	K1 14V Power Module	14V Power Module	Accessory DC Power Control Module
2	T18 Battery Charger	Battery Charger Control Module data list within Hybrid Powertrain Control Module 2	Drive Motor Battery Charger
3	Electronics Coolant Reservoir	Not Applicable	Drive Motor Battery Radiator Surge Tank
4	T12 Automatic Transmission Assembly coolant inlet and outlet ports	Not Applicable	Not Applicable
5	G35 Hybrid/EV Electronics Coolant Pump	Hybrid/EV Electronics Coolant Pump	Drive Motor Battery Coolant Pump
6	Power Electronics Coolant Radiator	Not Applicable	Engine Coolant Fan Module Radiator
7	T6 Power Inverter Module	• Hybrid Powertrain Control Module • Drive Motor Control Module 1	Drive Motor Power Inverter Module

The primary purpose of the hybrid/EV electronics cooling loop is to cool the T6 power inverter module, T18 battery charger, K1 14V power module and the transmission. The hybrid/EV electronics cooling system uses the hybrid/EV electronics radiator, engine control module inputs, a radiator fan and the 12 V G35 hybrid/EV electronics coolant pump to circulate coolant through the system. The K114B hybrid/EV powertrain control module 2 activates the G35 hybrid/EV electronics coolant pump and monitors the B202 hybrid/EV electronics coolant temperature sensor in the radiator. The coolant pump will be activated when the vehicle is on and during charging.

The hybrid/EV electronics cooling system circulates a pre-mixed DEX-COOLÂ® which is a 50/50 mixture of DEX-COOLÂ® and de-ionized water. De-ionized water is required for high voltage isolation and to prevent corrosion from effecting heat sink performance. Always use pre-mixed coolant and never use tap water in the hybrid/EV electronics coolant system.

Hybrid/EV Battery Pack Cooling System Description and Operation

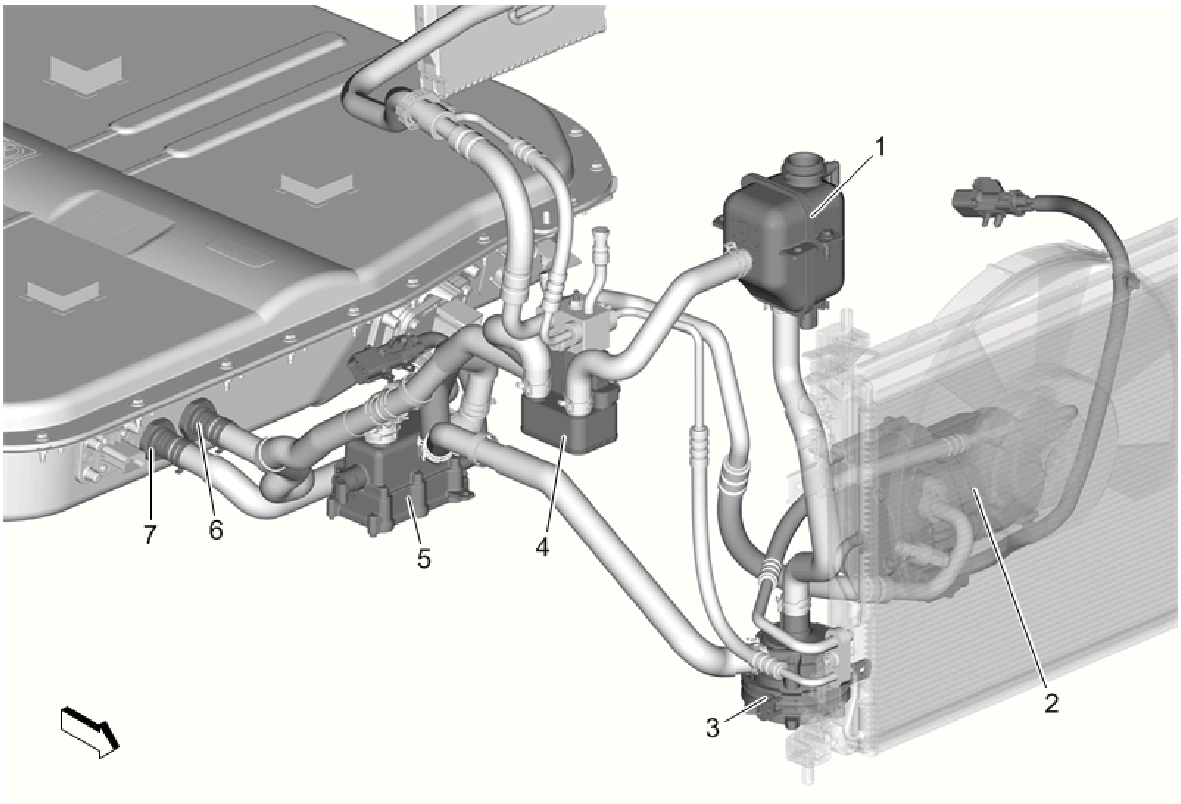

Fig. 244: Hybrid/EV Battery Pack Cooling System Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Schematic Reference or Generic Name	Scan Tool Reference	Service Information Part Name or Electronic Part Catalog Name
1	Coolant Surge Tank	Not Applicable	Drive Motor Battery Radiator Surge Tank
2	G1 A/C Compressor	Electric A/C Compressor Control Module	Air Conditioning Compressor
3	G37 Hybrid/EV Battery Pack Coolant Pump	Hybrid/EV Battery Pack Coolant Pump	Drive Motor Battery Coolant Pump
4	Refrigerant/Coolant Heat Exchanger or Chiller	Not Applicable	Drive Motor Battery Coolant Cooler
5	E54 Hybrid/EV Battery Pack Coolant Heater	Hybrid/EV Battery Pack Heater	High Voltage Battery Heater
6	Hybrid/EV Battery Pack Coolant Outlet	Not Applicable	Cell Battery Cooling Manifold - Outlet
7	Hybrid/EV Battery Pack Coolant Inlet	Not Applicable	Cell Battery Cooling Manifold - Inlet

The Hybrid/EV battery pack cooling system uses a 12 V G37 hybrid/EV battery pack coolant pump, a refrigerant/coolant heat exchanger (chiller) and the G1 A/C compressor to cool down the high voltage hybrid/EV battery. There is also the high voltage E54 Hybrid/EV Battery Pack Coolant Heater external of the hybrid/EV battery to heat the coolant entering the hybrid/EV battery when needed. The K114B hybrid/EV powertrain control module 2 monitors the B204A hybrid/EV battery coolant temperature sensor 1, hybrid/EV battery cell temperature sensors, refrigerant temperature, refrigerant pressure, and the B258 hybrid/EV battery coolant level switch. The K114B hybrid/EV powertrain control module 2 determines how much hybrid/EV battery cooling or heating is required and turns on the G37 hybrid/EV battery pack coolant pump. Depending on what is required, it will operate the radiator fan and request the A/C Compressor Module to turn on the high voltage A/C compressor, or turn on the high voltage E54 hybrid/EV battery pack coolant heater. The hybrid/EV battery pack cooling system could be activated when the vehicle is operating, during charging, or when the vehicle is OFF and maintaining the hybrid/EV battery pack temperature. Refer to **Automatic HVAC Description and Operation** .

The B258 hybrid/EV battery pack coolant level switch is attached to the coolant surge tank. The level sensor is a 2 state switch which changes state when the level in the surge tank gets low. The K114B hybrid/EV powertrain control module 2 uses the coolant level switch to determine if disabling the hybrid/EV battery pack charging operation is necessary due to a loss of coolant.

The hybrid/EV battery pack cooling system circulates a pre-mixed DEX-COOLÂ® which is a 50/50 mixture of DEX-COOLÂ® and de-ionized water. De-ionized water is required for high voltage isolation and to prevent corrosion from effecting heat sink performance. Always use pre-mixed coolant and never use tap water in the battery coolant system.

Passenger Compartment Heater System Description and Operation

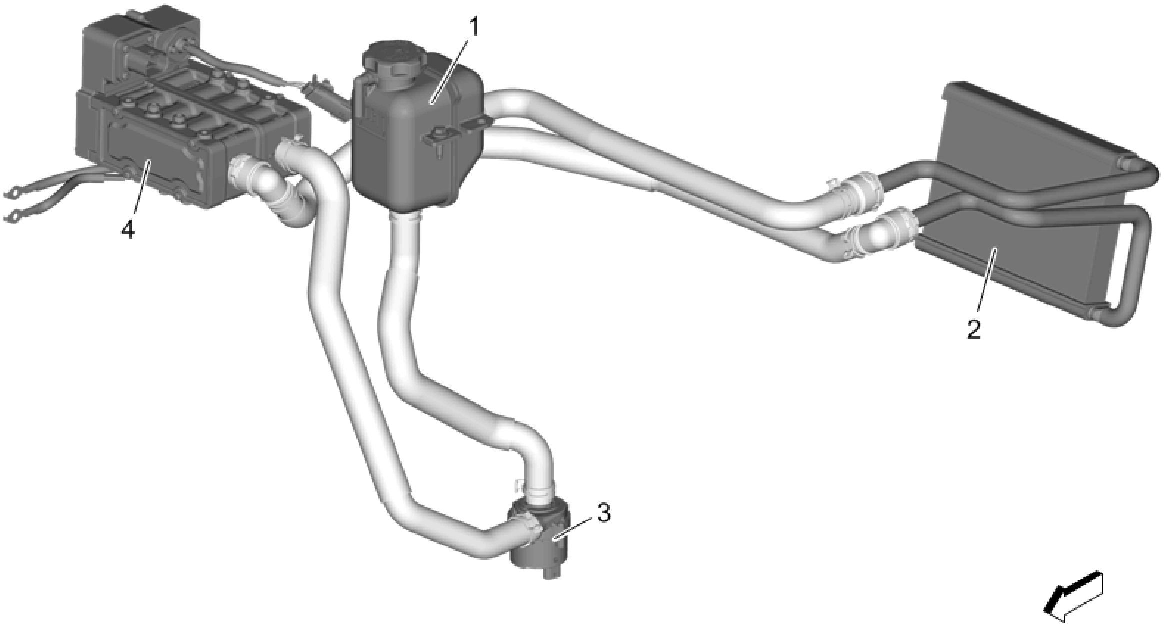

Fig. 245: Passenger Compartment Heater System Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Schematic Reference or Generic Name	Scan Tool Reference	Service Information Part Name or Electronic Part Catalog Name
1	Coolant Surge Tank	Not Applicable	Heater Coolant Surge Tank
2	Heater Core	Not Applicable	Heater Assembly
3	G17 Heater Coolant Pump	Not Applicable	Heater Coolant Pump
4	K10 Coolant Heater Control Module	Electric Passenger Compartment Heater	Heater Coolant Heater

The passenger compartment heater system uses the 12 V G17 heater coolant pump, high voltage K10 coolant heater control module and a heater core.

The K33 HVAC control module monitors the temperature sensors in the passenger compartment and coolant loop to determine if high voltage K10 coolant heater control module and G17 heater coolant pump operation is needed. Passenger compartment heat is provided by air flowing through the heater core. Refer to **Automatic HVAC Description and Operation** .

The passenger compartment heater cooling system circulates a 50/50 mixture of DEX-COOLÂ® and deionized water.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0CF4-P0CF6: CONTROL PILOT CIRCUIT (NORTH AMERICA, KOREA)

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC P0CF4

Control Pilot Circuit Performance

DTC P0CF5

Voltage A/C Ground	-	P0D59, 1	1	-
1. Plug In Charging Malfunction				

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors a control pilot signal from the drive motor battery charger cable. The hybrid/EV powertrain control module 2 utilizes this signal to manage the charging process between the drive motor battery charger cable and the hybrid/EV powertrain control module 2.

Under normal charging conditions the control pilot signal is generated by the drive motor battery charger cable. This diagnostic runs with the drive motor battery charger cable disconnected to verify the vehicle side circuit integrity. The diagnostic signal is generated internally by the hybrid/EV powertrain control module 2.

Conditions for Running the DTC

DTC P0CF4

- The vehicle 12 V battery system voltage needs to be above 10.2 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- The vehicle needs to be driven above 8 km/h (5 mph).

DTC P0CF5

- The vehicle 12 V battery system voltage needs to be above 10.2 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.

DTC P0CF6

- The vehicle 12 V battery system voltage needs to be above 10.2 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- Vehicle needs to be driven above 8 km/h (5 mph).

Conditions for Setting the DTC

DTC P0CF4

The control pilot circuit is not meeting its internal range requirements for 5 seconds. This can only be set internal to the hybrid/EV powertrain control module 2. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

DTC P0CF5

The control pilot circuit voltage divided by the system voltage is less than 0.03 V for 5 seconds. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

DTC P0CF6

The control pilot circuit voltage divided by the system voltage is greater than 0.55 V for 5 seconds. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

Actions Taken When the DTC Sets

- DTC P0CF4-P0CF6 are type A DTCs.
- Disables high voltage battery charging.

Conditions for Clearing the DTC

DTC P0CF4-P0CF6 are type A DTCs.

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T18 Battery Charger. Refer to **High Voltage Disabling** . Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

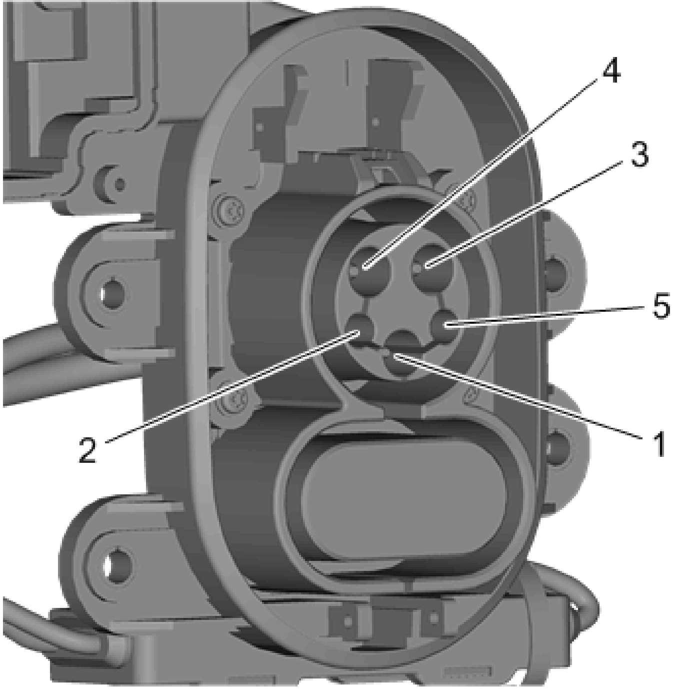

Fig. 9: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

2. Test for infinite resistance between the control pilot signal circuit terminal 2 of the X98 Hybrid/EV Battery Charger Receptacle and the terminals listed below:
   - Terminal 1
   - Terminal 3
   - Terminal 4
   - Terminal 5
   - **If less than infinite resistance**
   1. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.

      NOTE: **This test is performed on the vehicle side of the harness connector.**

   2. Test for infinite resistance between the harness connector control pilot signal circuit terminal 2 and the terminals listed below:
   - Terminal 1
   - Terminal 3
   - Terminal 4
   - Terminal 5
     - If less than infinite resistance, repair the short between the circuits.
     - If infinite resistance, replace the X98 Hybrid/EV Battery Charger Receptacle.
   - **If infinite resistance**
3. Test for less than 2 Ω in the control pilot signal circuit end to end.
   - **If 2 Ω or greater**
   1. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.

      NOTE: **This test is performed at the X98 Hybrid/EV Battery Charger Receptacle.**

   2. Test for less than 2 Ω in the control pilot signal circuit end to end.
     - If 2 Ω or greater, replace the X98 Hybrid/EV Battery Charger Receptacle.
     - If less than 2 Ω, repair the open/high resistance in the circuit.
   - **If less than 2 Ω**

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)**
- **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0CF9 OR P0D01: CONTROL PILOT CHARGING SWITCH/VENTILATION SWITCH PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0CF9

Control Pilot Charging Switch Performance

DTC P0D01

Control Pilot Charging Ventilation Switch Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control Pilot Signal	P0CF4, P0CF5, P0CF6, P0CF9, P0D01, 1	P0CF4, P0CF5, P0CF6, 1	P0CF4, P0CF5, P0CF6, P0CF9, 1	P0CF4, P0CF5, P0CF6, 1
Proximity Signal	P0D58, 1	P0D59, 1	P0D59, 1	-
Voltage A/C Line 1	1	P0D3F, P1EE6	1	-
Voltage A/C Neutral Line 2	1	P1EE6	1	-
Voltage A/C Ground	-	P0D59, 1	1	-
1. Plug In Charging Malfunction				

Circuit/System Description

The hybrid/EV powertrain control module 2 has two internal switches used to modify the control pilot signal. The first internal switch modifies the control pilot signal to indicate to the drive motor battery charger cable that the vehicle is either ready or not ready to accept energy. The second internal switch modifies the control pilot signal to indicate to some drive motor battery charger cables (currently not used) if indoor ventilation is required.

Conditions for Running the DTC

DTC P0CF9

- The 12 V battery voltage is greater than 10.2 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- The diagnostics for DTC P0CF4 - P0CF6 must have passed.

DTC P0D01

- The 12 V battery voltage is greater than 10.2 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.

- The diagnostics for DTC P0CF4 - P0CF6 and P0CF9 must have passed.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 measures the control pilot signal voltage out of range for 5 seconds. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

Actions Taken When the DTC Sets

- DTC P0CF9 and P0D01 are type A DTCs
- Disables the high voltage battery charging.

Conditions for Clearing the DTC

DTC P0CF9 and P0D01 are type A DTCs.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC P0CF9 or P0D01 is not set.
   - **If either of the DTCs are set**

     Replace the K114B Hybrid/EV Powertrain Control Module 2.

   - **If none of the DTCs are set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0D1F: CONTROL MODULE DATE/TIME SYNCHRONIZATION PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D1F

Control Module Date/Time Synchronization Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the date and time data it receives from the radio. This time information is used to ensure the module's internal clock is synchronized to the customer's local time. The Time of Day Charging feature utilizes this internal clock to keep track of time and alarms for delayed charging modes. If this radio time data is received during a drive cycle, the system is considered synchronized.

Conditions for Running the DTC

Vehicle in Service Mode.

Conditions for Setting the DTC

The vehicle is driven for more than 5 consecutive drive cycles where trip distance exceeds 15 Km (9.3 mi), and the date and time were unavailable from the radio.

Actions Taken When the DTC Sets

- DTC P0D1F is a type C DTC.
- On the Navigation screen "Default Charge Mode: Immediately" is displayed.
- The battery charger Time Of Day charging option is disabled, and charging mode is set to IMMEDIATE.

Conditions for Clearing the DTC

DTC P0D1F is a type C DTC.

Circuit/System Verification

1. Vehicle in Service Mode, verify no radio DTCs are set.
    - **If any radio DTC's are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
    - **If no radio DTC's are set**
2. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0D26: BATTERY CHARGER SYSTEM PRECHARGE TIME TOO LONG

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D26

Battery Charger System Precharge Time Too Long

Circuit/System Description

In order to prevent large in-rush current, battery charger bus high voltage is routed through a pre-charge resistor whenever high voltage charging is commanded ON. The hybrid/EV powertrain control module 2 monitors the time it takes the battery charger bus voltage to attain the same level as the battery pack voltage. If it takes too long, a DTC is set.

Conditions for Running the DTC

- Battery charger must go from disconnected to connected.
- Drive motor battery charger cable must be connected and vehicle receiving power.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 determines the battery charger does not reach its pre-charge voltage within 1 second.

Actions Taken When the DTC Sets

DTC P0D26 is a Type A DTC.

Conditions for Clearing the DTC

DTC P0D26 is a Type A DTC.

Special Tools

- **EL-48900** HEV Safety Kit
- For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Verify DTC P0C78 is not set.
   - **If the DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If the DTC is not set**
2. Verify DTC P0CF4, P0CF5, P0CF6, P0D4E, P0D4F, P0D58, or P0D59 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Connect the drive motor battery charger cable. Verify DTC P0D26 is not set and the vehicle will charge.
   - **If the DTC is set and the vehicle will not charge**

     Refer to Circuit/System Testing.

   - **If the DTC is not set and the vehicle charges**
4. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF. Remove the G37 Hybrid/EV Battery Pack Coolant Pump fuse. Set the vehicle Charge Mode to IMMEDIATE. Connect the charge cord set. Vehicle in Service Mode.

NOTE: **Do not command the heater ON any longer than is necessary to confirm the heater has high voltage and is functioning.**

2. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor parameter increases 2.75Ã‚Â°C (4.9Ã‚Â°F) within 120 s when commanding the hybrid/EV battery pack coolant heater ON with a scan tool.
   - **If the Hybrid/EV Battery Pack Coolant Temperature Sensor did not increase**
   1. Install the G37 Hybrid/EV Battery Pack Coolant Pump fuse. Disable the high voltage system for servicing the T24 Battery Charger and the A4 Battery Pack. Refer to **High Voltage Disabling** .
   2. Disconnect the T24 battery charger X7 connector and the A4 battery pack X4 connector.
   3. Inspect all connector ends for evidence of poor terminal contact and/or arc flash damage.
      - If a terminal concern is observed, replace all affected components.
      - If a terminal concern is not observed
   4. Test the following HV harness terminals for less than 2 Ω end to end:
      - X7-A to X4-A
      - X7-B to X4-B
      - If greater than 2 Ω, replace the HV Bat Pos & Neg (300V) Cable.
      - If less than 2 Ω
   5. Remove and open the A4 Battery Pack. Refer to **Battery Upper Cover Replacement** . Inspect for any of the following INTERNAL concerns:
      - Drive motor battery charger cable for loose/damaged terminal fasteners
      - High voltage battery disconnect relay fuse for loose/damaged fasteners or an open fuse condition
      - If a terminal concern is found, replace all affected components.
      - If an open fuse condition is found, replace the fuse, the T18 Battery Charger and the K1 14V Power Module.
      - If no internal concerns are observed, replace the A28 Hybrid/EV Battery Contactor Assembly.
   - **If the Hybrid/EV Battery Pack Coolant Temperature Sensor did increase**
3. Install the G37 Hybrid/EV Battery Pack Coolant Pump fuse. Disable the high voltage system for servicing the T18 Battery Charger, K1 14V Power Module and the T24 Battery Charger-DC. Refer to **High Voltage Disabling** .
4. Disconnect the X3 connector at the T18 Battery Charger, the X1 connector at the K1 14V Power Module and the X6 connector at the T24 Battery Charger-DC.
5. Verify that all HV harness connector and the mating module connector terminals are free from moisture, corrosion, and arc flash damage.
   - **If any terminals show signs of damage**

     Replace the HV wiring harness and affected modules as necessary.

   - **If no arc flash damage, moisture, or corrosion is found**
6. Test the following HV harness terminals for less than 2 Ω end to end:
   - X6-A to X1-A
   - X6-A to X3-A

  - X6-B to X1-B
  - X6-B to X3-B
  - **If greater than 2 Ω**

    Replace the HV wiring harness.

  - **If less than 2 Ω**

7. Replace the T18 Battery Charger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **300-Volt Battery Positive and Negative Cable Replacement (Generator Battery Control Wiring Junction Block to Drive Motor Battery)** for T24 Battery Charger-DC to A4 Battery Pack cable
- **Battery to Battery Positive Cable Replacement** for K1 14V Power Module/T18 Battery Charger combination cable - includes G1 A/C compressor cable
- **High Voltage Battery Disconnect Relay Replacement** for A28 Hybrid/EV Battery Contactor Assembly
- **High Voltage Battery Disconnect Relay Fuse Replacement** for F1HA 40A charging system fuse
- **Control Module References** for T18 Battery Charger, T24 Battery Charger-DC, or K1 14V Power Module replacement, programming and setup

DTC P0D2B OR P0D2C: CONTROL PILOT INDICATOR CONTROL CIRCUIT/CHARGE STATUS INDICATOR CONTROL CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D2B

Control Pilot Indicator Control Circuit

DTC P0D2C

Charge Status Indicator Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Charge Pilot Indicator Control	P0D2B	P0D2B	P0D2B	-
Charge Status Indicator Control	P0D2C	P0D2C, 1	P0D2C	-
Charge Complete Indicator Control	1	1	1	-
Low Reference	-	P0D2C, P0D2B	-	-
1. Plug In Charging Indicator Malfunction				

Circuit/System Description

The status of charging events (including delays) is communicated to the user through a charge status indicator and audio tones. The vehicle charge status indicator, located on the top middle of the instrument panel, contains a green LED (charge status indicator) and yellow LED (charge pilot indicator) controlled by the Hybrid Powertrain Control Module 2 and a second green LED (charge complete indicator) controlled by the BCM. The indicator will have a short flash green when the vehicle is charging under automatic control. The flash rate increases from one to four as the battery charges. It will have a long flash green if the charging is delayed and will begin later. It will be illumined solid green when charging is complete. A solid lit yellow indicator means the vehicle is not able to accept a charge.

And if there is no indicator lit it means the electronic vehicle supply equipment is not working properly or connected.

Conditions for Running the DTC

Both conditions need to run for diagnostic to pass.

Condition 1

The drive motor battery charger cable is disconnected (charge status indicator commanded OFF).

Condition 2

The vehicle is connected to an AC supply and the battery charger is charging the vehicle (charge status indicator commanded ON).

Conditions for Setting the DTC

- Charge status indicator Commanded OFF, The hybrid/EV powertrain control module 2 detects a short to battery for about 4 s.
- Charge status indicator Commanded ON, The hybrid/EV powertrain control module 2 detects a short to ground or an open/high resistance for 4 s.

Actions Taken When the DTC Sets

DTC P0D2B and P0D2C are type C DTCs.

Conditions for Clearing the DTC

DTC P0D2B and P0D2C are type C DTCs.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator.
2. Test for less than 10 Ω between the low reference terminal 1 and ground.

- **If 10 Ω or greater**

  Repair the open/high resistance in the circuit.

- **If less than 10 Ω**

NOTE: **If the drive motor battery charger cable is connected. The drive motor battery charger cable must be disconnected for more than 10 seconds before performing the next step.**

3. Connect a test lamp between the control circuit terminal 4 and ground.
4. Verify the test lamp does not illuminate.
   - **If the test lamp does illuminate**
   1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage in the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp does not illuminate**
5. Connect the drive motor battery charger cable.
6. Verify that the test lamp illuminates within the first 5 seconds of connecting the drive motor battery charger cable.
   - **If the test lamp does not illuminate**
   1. Disconnect the drive motor battery charger cable. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the control circuit and ground
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp does illuminate**
7. Disconnect the drive motor battery charger cable for at least 10 seconds. Connect a test lamp between the control circuit terminal 3 and ground.
8. Verify the test lamp does not illuminate.
   - **If the test lamp does illuminate**
   1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage in the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp does not illuminate**
9. Connect the drive motor battery charger cable.
10. Verify that the test lamp illuminates within 25 seconds of connecting the drive motor battery charger cable.
    - **If the test lamp does not illuminate**
    1. Disconnect the drive motor battery charger cable. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control circuit and ground
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp does illuminate**
11. Replace the B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Sun Load, Ambient Light, and Charge Indicator Sensor Replacement** for B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator replacement.
- **Control Module References** for K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0D3E-P0D40: BATTERY CHARGER INPUT VOLTAGE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D3E

Battery Charger Input Voltage Sensor Performance

DTC P0D3F

Battery Charger Input Voltage Sensor Circuit Low Voltage

DTC P0D40

Battery Charger Input Voltage Sensor Circuit High Voltage

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the AC voltage sensor inside the battery charger. The signal is pulse-width modulated and the duty cycle increases as the AC voltage increases. The duty cycle equals 10% when the AC voltage sensor reports less than 60 V. The duty cycle equals 90% when the AC voltage sensor reports more than 280 V. Therefore, during normal operation the duty cycle is between 10% and 90%.

Conditions for Running the DTC

P0D3E

- The 12 V battery voltage is greater than 10.2 V.
- The vehicle is driven above 16 km/h (10 mph).

P0D3F and P0D40

- The 12 V battery voltage is greater than 10.2 V.
- The vehicle is connected to an AC supply and the battery charger is charging the vehicle.

Conditions for Setting the DTC

DTC P0D3E

The battery charger AC input duty cycle is greater than 12% or less than 8%.

DTC P0D3F

The battery charger AC input duty cycle is between 1% and 8%.

OR

The battery charger AC input duty cycle equals 100%.

DTC P0D40

The battery charger AC input duty cycle is between 92% and 99%.

OR

The battery charger AC input duty cycle equals 0%.

Actions Taken When the DTC Sets

- DTC P0D3E, P0D3F and P0D40 are type B DTCs.
- Disables high voltage battery charging.

Conditions for Clearing the DTC

DTC P0D3E, P0D3F and P0D40 are type B DTCs.

Circuit/System Verification

1. Drive the vehicle above 16 km/h (10 mph).
2. Vehicle OFF. Connect the vehicle to an AC supply to begin charging.
3. Vehicle in Service Mode.
4. Verify that DTC P0D3E, P0D3F, or P0D40 is not set.
    - **If any of the DTCs are set**

      Refer to Circuit/System Testing.

    - **If none of the DTCs are set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the T18 Battery Charger. Vehicle in Service Mode.
2. Verify the scan tool Battery Charger AC Input Status Duty Cycle parameter is less than 10%.
    - **If 10% or greater**

    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the AC voltage sensor circuit terminal 10 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than 10%**
3. Install a 3 A fused jumper wire between the AC voltage sensor circuit terminal 10 and the ground circuit terminal 2.
4. Verify the scan tool Battery Charger AC Input Status Duty Cycle parameter is greater than 90%.
    - **If 90% or less**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the AC voltage sensor circuit terminal 10 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the AC voltage sensor circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If greater than 90%**
5. Replace the T18 Battery Charger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for K114B Hybrid/EV Powertrain Control Module 2 or T18 Battery Charger replacement, programming and setup

DTC P0D4D-P0D4F: BATTERY CHARGER HYBRID/EV BATTERY OUTPUT VOLTAGE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D4D

Battery Charger Hybrid/EV Battery Output Voltage Sensor Performance

DTC P0D4E

Battery Charger Hybrid/EV Battery Output Voltage Sensor Circuit Low Voltage

DTC P0D4F

Battery Charger Hybrid/EV Battery Output Voltage Sensor Circuit High Voltage

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the DC voltage sensor inside the battery charger. The signal is pulse-width modulated and the duty cycle increases as the DC voltage increases. The duty cycle equals 10% when the DC voltage sensor reports less than 0 V. The duty cycle equals 90% when the DC voltage sensor reports more than 500 V. Therefore, during normal operation the duty cycle is between 10% and 90%.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 10.2 V.
- The vehicle is connected to an AC supply and the battery charger is charging the vehicle.

Conditions for Setting the DTC

DTC P0D4D

The difference between the battery charger DC output voltage and hybrid/EV battery DC input voltage is greater than 30 V.

DTC P0D4E

The battery charger DC output duty cycle is between 1% and 8%.

OR

The battery charger DC output duty cycle equals 100%.

DTC P0D4F

The battery charger DC output duty cycle is between 92% and 99%.

OR

The battery charger DC output duty cycle equals 0%.

Actions Taken When the DTC Sets

- DTC P0D4D, P0D4E and P0D4F are type B DTCs.
- Disables high voltage battery charging.

Conditions for Clearing the DTC

DTC P0D4D, P0D4E and P0D4F are type B DTCs.

Circuit/System Verification

1. Verify that DTC P0D4E or P0D4F is not set.
   - **If any of the DTCs are set**

     Refer to Circuit/System Testing.

   - **If none of the DTCs are set**
2. Connect the vehicle to an AC supply to begin charging. Vehicle in Service Mode.
3. Verify that DTC P0D26 is not set.
   - **If the DTC is set**

     Refer to **DTC P0D26**.

   - **If the DTC is not set**
4. Verify that DTC P0D4D is not set.
   - **If the DTC is set**

     Refer to Circuit/System Testing.

   - **If the DTC is not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the T18 Battery Charger. Vehicle in Service Mode.
2. Verify the scan tool Battery Charger DC Output Status Duty Cycle parameter is less than 10%.
   - **If 10% or greater**
     1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
     2. Test for infinite resistance between the DC voltage sensor circuit terminal 3 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 10%**
3. Install a 3 A fused jumper wire between the DC voltage sensor circuit terminal 3 and the ground circuit terminal 2.
4. Verify the scan tool Battery Charger DC Output Status Duty Cycle parameter is greater than 90%.
   - **If 90% or less**
     1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
     2. Test for less than 1 V between the DC voltage sensor circuit terminal 3 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
     3. Vehicle OFF.
     4. Test for less than 2 Ω in the DC voltage sensor circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If greater than 90%**
5. Replace the T18 Battery Charger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for K114B Hybrid/EV Powertrain Control Module 2 or T18 Battery Charger replacement, programming and setup.

DTC P0D57-P0D59: PROXIMITY DETECTION CIRCUIT(NORTH AMERICA, KOREA)

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D57

Proximity Detection Circuit Performance

DTC P0D58

Proximity Detection Circuit Low Voltage

DTC P0D59

Proximity Detection Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
AC Voltage Line 1	P1EE6	P1EE6	-	-
AC Voltage Line 2	P1EE6	P1EE6	-	-
AC Voltage Ground	1	P1EE6	1	-

Proximity Signal	P0D57, P0D58	P0D57, P0D59	P0D57, P0D59	P0D57
1. Plug In Charging Malfunction				

Circuit/System Description

The proximity detection circuit prevents movement of the vehicle while the drive motor battery charger cable is connected. This diagnostic runs with the drive motor battery charger cable disconnected to verify the vehicle side circuit integrity.

Conditions for Running the DTC

P0D57

- The 12 V battery voltage is greater than 10.2 V.
- DTC P0D58 and P0D59 are not set.

P0D58 and P0D59

- The 12 V battery voltage is greater than 10.2 V.
- The vehicle speed is greater than 20 km/h (15 mph).
- No vehicle speed DTCs are set.

Conditions for Setting the DTC

DTC P0D57

The hybrid/EV powertrain control module 2 measures a voltage less than 1.0 V or greater than 4.8 V on the Proximity Detection circuit.

OR

The hybrid/EV powertrain control module 2 measures a voltage between 2.0 V and 2.2 V on the Proximity Detection circuit.

OR

The hybrid/EV powertrain control module 2 measures a voltage between 3.4 V and 4.2 V on the Proximity Detection circuit.

DTC P0D58

The hybrid/EV powertrain control module 2 measures a voltage less than 4.2 V for 5 seconds.

DTC P0D59

The hybrid/EV powertrain control module 2 measures a voltage greater than 4.8 V for 5 seconds.

Actions Taken When the DTC Sets

- DTC P0D57 is a type B DTCs.
- DTC P0D58 and P0D59 are type A DTCs

Conditions for Clearing the DTC

- DTC P0D57 is a type B DTCs.
- DTC P0D58 and P0D59 are type A DTCs

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**

- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T18 Battery Charger. Refer to High Voltage Disabling .

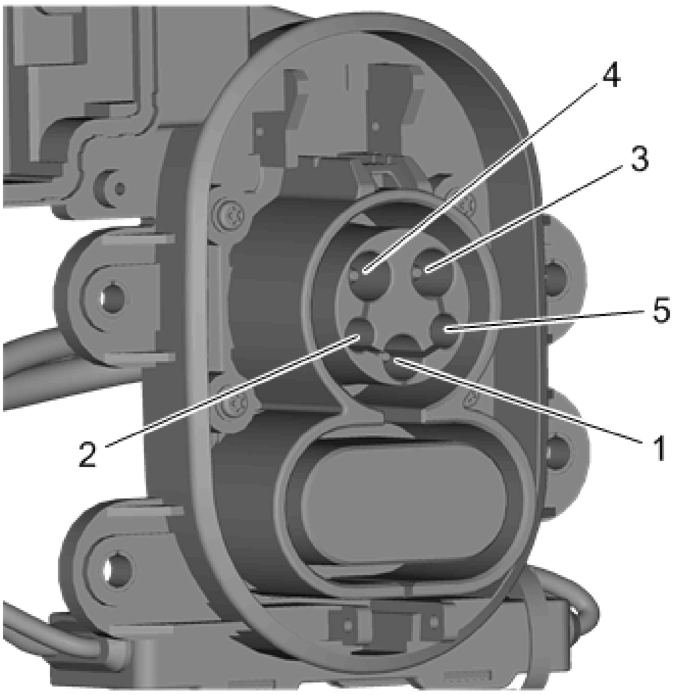

Fig. 10: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle face and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.
   - **If 10 Ω or greater**

     NOTE: **G108 is located behind the front fender.**

     1. Disconnect the G108 ring terminal. Refer to Ground Nut removal in Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge).
     2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, replace the X98 Hybrid/EV Battery Charger Receptacle.
        - If less than 2 Ω, clean and reinstall the G108 ring terminal and ground nut.
   - **If less than 10 Ω**
3. Connect the 12 V battery. Vehicle in Service Mode.

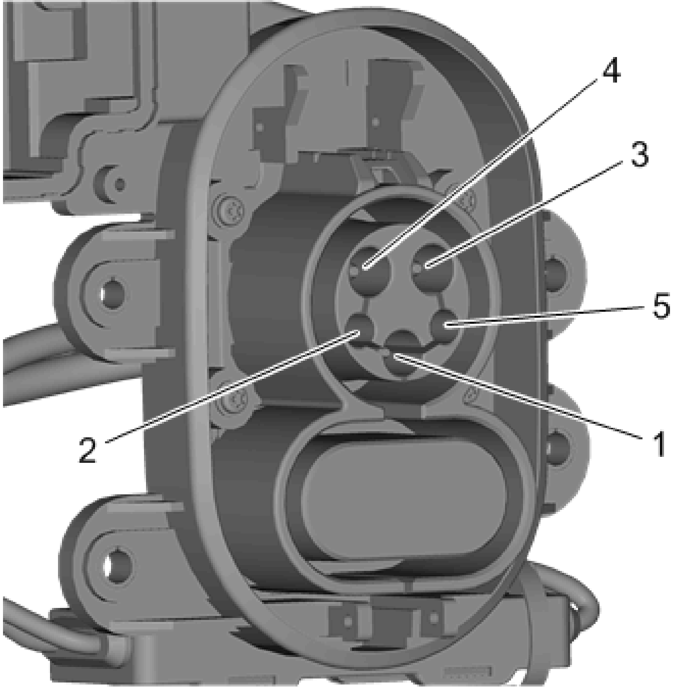

Fig. 11: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

4. Test for 4.2 - 4.8 V between the signal circuit terminal 5 and ground.
    - **If less than 4.2 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.

    NOTE: **The following tests are performed at the vehicle harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

    2. Test for 4.8 V or greater between the signal circuit terminal 5 and ground.
        - If less than 4.8 V
        1. Vehicle OFF. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
        2. Test for infinite resistance between the signal circuit terminal 5 and ground.
            - If less than infinite resistance, repair the short to ground in the circuit.
            - If infinite resistance
        3. Test for less than 2 Ω in the signal circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
        - If 4.8 V or greater, replace the X98 Hybrid/EV Battery Charger Receptacle.
    - **If greater than 4.8 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.

    NOTE: **The following tests are performed at the vehicle harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

    2. Test for 4.8 - 5.2 V between the signal circuit terminal 5 and ground.
        - If greater than 5.2 V
        1. Vehicle OFF. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
        2. Vehicle in Service Mode. Test for less than 1 V between the signal circuit terminal 5 and ground.
            - If 1 V or greater, repair the short to voltage in the circuit.
            - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
        - If within 4.8 - 5.2 V

3. Test for 2.565 - 2.835K Ω between the signal circuit terminal 5 and the low reference circuit terminal 1 at the face of the X98 Hybrid/EV Battery Charger Receptacle.
    - If not within the specified range, replace the X98 Hybrid/EV Battery Charger Receptacle.
    - If within the specified range, replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If within 4.2 - 4.8 V**

5. Test for infinite resistance between signal circuit terminal 5 of the X98 Hybrid/EV Battery Charger Receptacle and the terminals listed below:
    - Terminal 2
    - Terminal 3
    - Terminal 4
    - **If less than infinite resistance**
    1. Vehicle OFF, disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.
    2. Retest for infinite resistance between signal circuit terminal 5 of the X98 Hybrid/EV Battery Charger Receptacle and the terminals listed below:
        - Terminal 2
        - Terminal 3
        - Terminal 4
        - If less than infinite resistance replace the X98 Hybrid/EV Battery Charger Receptacle.
        - If infinite resistance, repair the short between the circuits in the vehicle wiring harness.
    - **If infinite resistance**
6. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)** for X98 Hybrid/EV Battery Charger Receptacle.
- **Control Module References** for battery charger or hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0D5A: PROXIMITY DETECTION CIRCUIT ERRATIC

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D5A

Proximity Detection Circuit Erratic

Circuit/System Description

This diagnostic runs with the drive motor battery charger cable connected. The hybrid/EV powertrain control module 2 uses a 5 V regulated signal through a 2700 Ω resistor to a low reference circuit in the battery charger to detect if the drive motor battery charger cable is attached.

Conditions for Running the DTC

The drive motor battery charger cable is connected.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 determines the proximity signal voltage is erratic for 40 seconds.

Actions Taken When the DTC Sets

DTC P0D5A is a type C DTC.

Conditions for Clearing the DTC

DTC P0D5A is a type C DTC.

Diagnostic Aids

The proximity status circuit is susceptible to moisture intrusion. If signs of moisture intrusion are observed in the hybrid/EV battery charger receptacle harness connector, the hybrid/EV battery charger receptacle should be replaced. If moisture is detected on one connector, always be sure to inspect the mating connector as well.

DTC P0D5E: BATTERY CHARGER SYSTEM HIGH VOLTAGE PRESENT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D5E

Battery Charger System High Voltage Present

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors are a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor, and precharge high voltage contactor. These contactors close and open in sequence and are controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage contactors. Ground is provided through the case ground.

Conditions for Running the DTC

- All contactors are commanded open.
- Runs once per charger contacts discharge event.
- None of the following DTCs are set: P0D4D, P0D4E or P0D4F.

Conditions for Setting the DTC

High voltage bus does not discharge to below 60 V within 4 seconds of the charger contactors being commanded open.

Actions Taken When the DTC Sets

- DTC P0D5E is a type A DTC.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

- DTC P0D5E is a type A DTC.
- The **Clear Secured High Voltage DTCs** reset function must be performed with a scan tool before clear codes.

[Control Module References] for scan tool information

Circuit/System Verification

NOTE: **The following setup steps must be performed exactly in order to exercise the contactors.**

1. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
2. OPEN the driver door using outside door handle. Leave driver door OPEN.

NOTE: **The brake pedal must remain depressed throughout the remainder of the contactor steps.**

3. PRESS and HOLD the brake pedal.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode.**

4. Command the Hybrid/EV Battery Contactors ALL OPEN with a scan tool.
5. Disconnect the S15 Manual Service Disconnect.

NOTE: **DO NOT use the Release Control button to turn OFF any of the contactors. Once the Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning.**

6. Command the Battery Charging System Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open. The KR116B Battery Charging System Positive Contactor should be heard closing and opening.
   - **If the Battery Charging System Positive Contactor does not open and close**

     Refer to Circuit/System Testing.

   - **If the Battery Charging System Positive Contactor does open and close**
7. Replace the T18 Battery Charger.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**

- **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
4. Verify that a test lamp illuminates between the A4 Hybrid/EV Battery Pack harness B+ circuit terminal 1 X357 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the A28 Hybrid/EV Battery Contactor Assembly and K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to **Battery Energy Control Module Replacement** .
    - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. Verify that a test lamp does not illuminate between the A4 Hybrid/EV Battery Pack harness control circuit terminal 5 X358 and ground.
    - **If the test lamp illuminates**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp does not illuminate**
7. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
8. Test for infinite resistance between the A4 Hybrid/EV Battery Pack harness control circuit terminal 5 X358 and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
9. Test for less than 2 Ω in the control circuit end to end.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**

10. Replace the K114B Hybrid/EV Powertrain Control Module 2.
11. Verify that DTC P0D5E does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If DTC P0D5E is set**

      Replace the A28 Hybrid/EV Battery Contactor Assembly.

    - **If DTC P0D5E is not set**
12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **High Voltage Battery Disconnect Relay Replacement** for A28 Hybrid/EV Battery Contactor Assembly.
- **Control Module References** for T18 Battery Charger, K16 Battery Energy Control Module, or K114B Hybrid/EV Powertrain Control Module 2 replacement, programming and setup.

DTC P0E61 OR P0E65: BATTERY CHARGER ENABLE/CONTROL CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0E61

Battery Charger Enable Circuit

DTC P0E65

Battery Charger Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Battery Charger Enable	P0E61	P0E61	P0E61	-
Battery Charger Control	P0E65	P0E65	P0E65	-

Circuit/System Description

The battery charger is controlled with a charger enable signal and a pulse width modulated (PWM) charger control circuit from the hybrid/EV powertrain control module 2. The charger enable signal is set to 12 V when the hybrid/EV powertrain control module 2 is awake. This allows the battery charger to operate while driving to allow DC voltage sensor operation.

Conditions for Running the DTC

DTC P0E61

The 12 V battery voltage is greater than 10.2 V.

DTC P0E65

- The 12 V battery voltage is greater than 10.2 V.
- Vehicle in Service Mode or the drive motor battery charger cable is connected.

Conditions for Setting the DTC

DTC P0E61

The hybrid/EV powertrain control module 2 detects an open, short to ground, or short to voltage on battery charger enable circuit for 1 second.

DTC P0E65

The hybrid/EV powertrain control module 2 detects an open, short to ground, or short to voltage on battery charger control circuit for 1 second.

Actions Taken When the DTC Sets

- DTC P0E61 and P0E65 are type B DTCs.
- Disables high voltage battery charging.

Conditions for Clearing the DTC

DTC P0E61 and P0E65 are type B DTCs.

Circuit/System Testing

1. Vehicle OFF. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Disconnect the X1 harness connector at the T18 Battery Charger.
2. Test for infinite resistance between the terminals listed below at the T18 Battery Charger X1 harness connector:
    - Battery charger enable terminal 11 and B+ terminal 9
    - Battery charger enable terminal 11 and ground terminal 2
    - Battery charger control terminal 4 and B+ terminal 9
    - Battery charger control terminal 4 and ground terminal 2
    - **If less than infinite resistance**

      Repair the short between the circuits.

    - **If infinite resistance**
3. Test for less than 2 Ω between the terminals listed below end to end:

    - T18 Battery Charger terminal 11 X1 and K114B Hybrid/EV Powertrain Control Module 2 terminal 44 X2
    - T18 Battery Charger terminal 4 X1 and K114B Hybrid/EV Powertrain Control Module 2 terminal 53 X2
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
5. Verify DTC P0E61 or P0E65 is not set.
    - **If any of the DTCs are set**

      Replace the T18 Battery Charger.

    - **If none of the DTCs are set**
6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P1ECE: BATTERY CHARGER TOTAL OUTPUT POWER PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P1ECE

Battery Charger Total Output Power Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the hybrid/EV battery pack voltage and current sensors to determine battery charger output power efficiency.

Conditions for Running the DTC

- The vehicle 12 V battery system voltage needs to be 10.2 V or greater.
- There cannot be any high voltage or current sensor faults present.
- Drive motor battery charger cable must be connected and vehicle receiving power.

Conditions for Setting the DTC

- Battery charger output power efficiency is less than 62% or greater than 167% for 80 minutes.
- Hybrid/EV electronics coolant temperature is between -12Ã‚Â°C (+10Ã‚Â°F) and +65Ã‚Â°C (+149Ã‚Â°F).

Actions Taken When the DTC Sets

- DTC P1ECE is a type A DTC.
- Disables the high voltage battery charging.

Conditions for Clearing the DTC

DTC P1ECE is a type A DTC.

Diagnostic Aids

The diagnostic consists of a passive efficiency test and active efficiency test. The passive test runs first, which takes a minimum of 80 minutes to mature. If the passive test fails, the active test is then run, which is intrusive. The DTC sets upon failure of the active test. The scan tool control function allows the active test to be run directly, eliminating the need to wait for the failure of the passive test.

The efficiency value is calculated by dividing the battery charger's output power by input power. A value less than 100% indicates power loss. A value more than 100% indicates an overcurrent condition and is less likely to occur.

DTC P1EE6 : BATTERY CHARGER AC VOLTAGE NOT PRESENT (NORTH AMERICA, KOREA)

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P1EE6

Battery Charger AC Voltage Not Present

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Voltage AC Line 1	P1EE6	P1EE6	-	-
Voltage AC Neutral Line 2	P1EE6	P1EE6	-	-
Voltage AC Ground	-	P1EE6	1	-
1. Plug In Charging Malfunction				

Circuit/System Description

The hybrid battery charger receptacle is connected to the battery charger through two AC circuits and one ground circuit. When the battery charger has been enabled by the hybrid/EV powertrain control module 2, the battery charger will provide an AC voltage measurement to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 allows charging to occur if proper AC voltage is present.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 10.2 V.
- The drive motor battery charger cable is connected.
- DTCs P0D3E, P0D3F, P0D40, or P0D5C is not set.

Conditions for Setting the DTC

The battery charger AC input voltage is below 5 V.

Actions Taken When the DTC Sets

- DTC P1EE6 is a type C DTC.
- Disables the vehicle high voltage battery charging.

Conditions for Clearing the DTC

DTC P1EE6 is a type C DTC.

Diagnostic Aids

The hybrid/EV battery charger receptacle contains internal fuses on Voltage AC Line 1 and Voltage AC Neutral Line 2 circuits. A battery charger internal failure may cause these fuses to blow. If an open circuit is found in the hybrid/EV battery charger receptacle, the battery charger may also need to be replaced.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Clear DTC, connect a known good drive motor battery charger cable to vehicle and household supply voltage.
2. Verify DTC P1EE6 is set.
   - **If DTC P1EE6 is not set**

     Replace customer's drive motor battery charger cable.

   - **If DTC P1EE6 is set**
3. Vehicle OFF, disable the high voltage at the T18 Battery Charger. Refer to **High Voltage Disabling**
4. Disconnect the X2 harness connector at the T18 Battery Charger.
5. Test into the harness for infinite resistance between the AC circuit terminals listed below and ground:
   - T18 Battery Charger terminal 1 X2

    - T18 Battery Charger terminal 4 X2
    - **If less than infinite resistance**
    1. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.
    2. Test into the harness for infinite resistance between the appropriate AC circuit terminal and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Replace the X98 Hybrid/EV Battery Charger Receptacle.
    - **If infinite resistance**

6. Test into the harness for infinite resistance between all the AC circuit terminals listed below:
    - T18 Battery Charger terminal 1 X2
    - T18 Battery Charger terminal 3 X2
    - T18 Battery Charger terminal 4 X2
    - **If less than infinite resistance**
    1. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.
    2. Test into the harness for infinite resistance between the three AC circuit terminals.
        - If less than infinite resistance, repair the short between the circuits.
        - If infinite resistance
    3. Replace the X98 Hybrid/EV Battery Charger Receptacle.
    - **If infinite resistance**

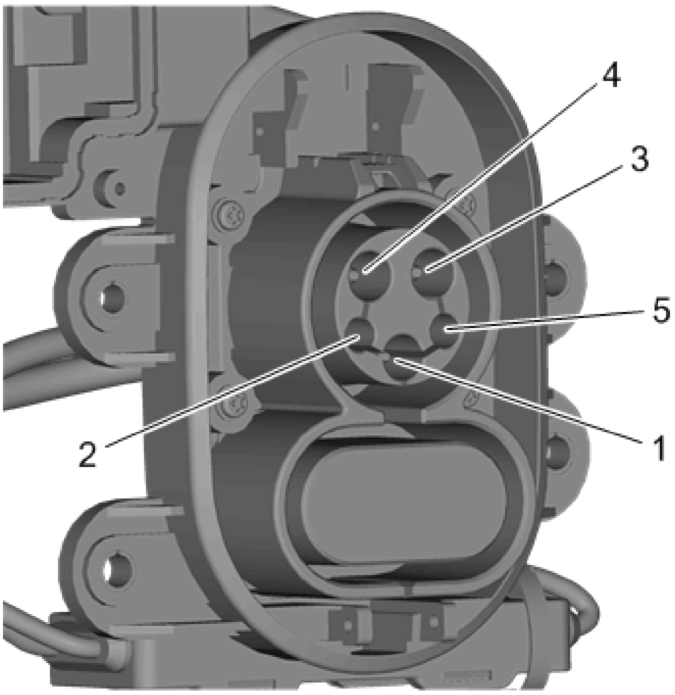

Fig. 12: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

7. Test for less than 10 Ω between the AC circuit terminals listed below:
    - T18 Battery Charger terminal 1 X2 and X98 Hybrid/EV Battery Charger Receptacle 3
    - T18 Battery Charger terminal 3 X2 and X98 Hybrid/EV Battery Charger Receptacle 1
    - T18 Battery Charger terminal 4 X2 and X98 Hybrid/EV Battery Charger Receptacle 4
    - **If 10 Ω or greater**
    1. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.
    2. Test for less than 2 Ω in the AC circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω
    3. Replace the X98 Hybrid/EV Battery Charger Receptacle.
    4. Verify the DTC does not set.

        - If the DTC sets, replace the T18 Battery Charger and X98 Hybrid/EV Battery Charger Receptacle.
        - If the DTC does not set

    5. All OK.

    - **If less than 10 Ω**

8. Replace the T18 Battery Charger.

DTC P3002, P3003, P301F, OR P3020: HYBRID/EV BATTERY DC CHARGING POSITIVE VOLTAGE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P3002

Hybrid/EV Battery DC Charging Positive Voltage Sensor Circuit Low Voltage

DTC P3003

Hybrid/EV Battery DC Charging Positive Voltage Sensor Circuit High Voltage

DTC P301F

Hybrid/EV Battery DC Charging Positive Voltage Sensor Stuck Low

DTC P3020

Hybrid/EV Battery DC Charging Positive Voltage Sensor Stuck High

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors for normal operation and regular (AC) charging, and 1 module. In vehicles with DC charging capability, there are two additional DC contactors that are housed in the battery charger - DC. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or safely contain the high voltage DC within the hybrid/EV battery assembly. The 6 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, AC charge positive high voltage contactor, precharge contactor, DC positive contactor, and DC negative contactor. The 1 module is the hybrid/EV battery pack coolant heater module. The contactors and module close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage contactors/module. Ground is provided through the case ground and chassis.

The hybrid/EV powertrain control module 2 measures internal voltages, currents, and temperatures within the battery charger - DC and charge receptacle and verifies they are within the proper range.

Conditions for Running the DTC

P3002 and P3003

The vehicle 12 V battery system voltage is greater than 10.2 V.

P301F

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The DC charge cable is connected.
- The vehicle is ready to be charged.
- The DC positive contactor is commanded OPEN.
- The charge control mode is precharge.
- The off board charger voltage limit command is greater than or equal to 201 V.
- DTC P3002 or P3003 is not set.

  OR

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The DC charge cable is connected.
- The vehicle is ready to be charged.
- The DC positive contactor is commanded CLOSED.
- The charge control mode is constant current.
- DTC P3002 or P3003 is not set.

P3020

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The DC charge cable is connected.
- The vehicle is ready to be charged.
- The DC positive contactor is commanded CLOSED.
- The charge control mode is constant current.
- DTC P3002 or P3003 is not set.

  OR

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- Vehicle in Service Mode or Vehicle ON.
- The DC charge cable is disconnected.
- The DC positive contactor is commanded OPEN.
- DTC P3002 or P3003 is not set.

Conditions for Setting the DTC

P3002

The hybrid/EV powertrain control module 2 detects the DC charging positive voltage sensor signal is out of range low. The signal percent is less than 5% for 1 s.

P3003

The hybrid/EV powertrain control module 2 detects the DC charging positive voltage sensor signal is out of range high. The signal percent is greater than 90% for 1 s.

P301F

- The DC Charging Positive Voltage Sensor bus voltage is less than or equal to 30 V.

  AND

- The DC Charging Negative Voltage Sensor bus voltage is greater than 30 V.

P3020

- The DC Charging Positive Voltage Sensor bus voltage is not within 20% of the hybrid/EV powertrain control module 1 bus voltage.

AND

- The DC Charging Positive Voltage Sensor bus voltage is greater than 20 V.

Action Taken When the DTC Sets

- DTC P3002, P3003, and P3020 are type A DTCs.
- DTC P301F is type B DTC.
- Disables DC high voltage battery charging.

Conditions for Clearing the DTC

- DTC P3002, P3003, and P3020 are type A DTCs.
- DTC P301F is type B DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Observe the scan tool DC Positive Supply Isolation Voltage parameter. The reading should be 0 V.
    - **If greater than 0 V**

      Refer to Circuit/System Testing

    - **If 0 V**
3. Verify that DTC P3002, P3003, P301F, or P3020 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If any of the DTCs are set**

      Refer to Circuit/System Testing.

    - **If none of the DTCs are set**
4. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down. Disconnect the X9 harness connector at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between the ground circuit terminal 9 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 8 and ground.
    - **If less than 4.8 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the 5 V reference circuit terminal 8 X9 and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for infinite resistance between the 5 V reference circuit terminal 5 X2 and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    4. Test for less than 2 Ω in the 5 V reference circuit terminal 8 X9 end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 5.2 V or greater**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the 5 V reference circuit terminal 8 X9 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 1 V between the 5 V reference circuit terminal 5 X2 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If within the specified range**
5. Test for less than 1 V between the signal circuit terminal 10 X9 and ground.
    - **If 1 V or greater**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If between 1 - 5 V, repair the short to voltage on the circuit.
        - If greater than 5 V, repair the short to voltage on the circuit and replace the T24 Battery Charger - DC.
        - If less than 1 V
    3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
    4. Verify that DTC P3002, P3003, P301F, or P3020 does not set while operating the vehicle within the Conditions for Running the DTC.
        - If any of the DTCs are set, replace the T24 Battery Charger - DC.
        - If none of the DTCs are set
    5. All OK.
    - **If less than 1 V**

6. Vehicle OFF, install a 3 A fused jumper wire between the signal circuit terminal 10 and the 5 V reference circuit terminal 8. Vehicle in Service Mode.
7. Verify the scan tool DC Positive Supply Isolation Voltage parameter is greater than 500 V.
   - **If less than 500 V**
   1. Test for infinite resistance between the signal circuit and ground.
      - If less infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   2. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If 500 V or greater**
8. Replace the T24 Battery Charger - DC.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for battery charger - DC and hybrid/EV powertrain control module 2 replacement, programming, and setup.

DTC P3005, P3006, P3021, OR P3022: HYBRID/EV BATTERY DC CHARGING NEGATIVE VOLTAGE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P3005

Hybrid/EV Battery DC Charging Negative Voltage Sensor Circuit Low Voltage

DTC P3006

Hybrid/EV Battery DC Charging Negative Voltage Sensor Circuit High Voltage

DTC P3021

Hybrid/EV Battery DC Charging Negative Voltage Sensor Stuck Low

DTC P3022

Hybrid/EV Battery DC Charging Negative Voltage Sensor Stuck High

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors for normal operation and regular (AC) charging, and 1 module. In vehicles with DC charging capability, there are two additional DC contactors that are housed in the battery charger - DC. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or safely contain the high voltage DC within the hybrid/EV battery assembly. The 6 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, AC charge positive high voltage contactor, precharge contactor, DC positive contactor, and DC negative contactor. The 1 module is the hybrid/EV battery pack coolant heater module. The contactors and module close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage contactors/module. Ground is provided through the case ground and chassis.

The hybrid/EV powertrain control module 2 measures internal voltages, currents, and temperatures within the battery charger - DC and charge receptacle and verifies they are within the proper range.

Conditions for Running the DTC

P3005 and P3006

The vehicle 12 V battery system voltage is greater than 10.2 V.

P3021

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The DC charge cable is connected.
- The vehicle is ready to be charged.
- The DC negative contactor is commanded OPEN.
- The charge control mode is precharge.
- The off board charger voltage limit command is greater than or equal to 201 V.
- DTC P3005 or P3006 is not set.

  OR

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The DC charge cable is connected.
- The vehicle is ready to be charged.
- The charge control mode is constant current.
- The DC negative contactor is commanded CLOSED.
- DTC P3005 or P3006 is not set.

P3022

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The DC charge cable is connected.
- The DC negative contactor is commanded CLOSED.
- The charge control mode is constant current.
- DTC P3005 or P3006 is not set.

  OR

- Vehicle in Service Mode or Vehicle ON.
- The DC charge cable is disconnected.
- The DC negative contactor is commanded OPEN.

Conditions for Setting the DTC

P3005

The hybrid/EV powertrain control module 2 detects the DC charging negative voltage sensor signal is out of range low. The signal percent is less than 5% for 1 s.

P3006

The hybrid/EV powertrain control module 2 detects the DC charging negative voltage sensor signal is out of range high. The signal percent is greater than 90% for 1 s.

P3021

- The DC Charging Negative Voltage Sensor bus voltage is less than or equal to 30 V.

  AND

- The DC Charging Positive Voltage Sensor bus voltage is greater than 30 V.

P3022

- The DC Charging Negative Voltage Sensor bus voltage is greater than 20 V.

AND

- The DC Charging Negative Voltage Sensor bus voltage is not within 20% of the hybrid/EV powertrain control module 1 bus voltage.

Action Taken When the DTC Sets

- DTC P3005, P3006, and P3022 are type A DTCs.
- DTC P3021 is type B DTC.
- Disables DC high voltage battery charging.

Conditions for Clearing the DTC

- DTC P3005, P3006, and P3022 are type A DTCs.
- DTC P3021 is type B DTC.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Observe the scan tool DC Negative Supply Isolation Voltage parameter. The reading should be 0 V.
    - **If greater than 0 V**

      Refer to Circuit/System Testing.

    - **If 0 V**
3. Verify that DTC P3005, P3006, P3021, or P3022 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If any of the DTCs are set**

      Refer to Circuit/System Testing.

    - **If none of the DTCs are set**
4. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down. Disconnect the X9 harness connector at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between the ground circuit terminal 9 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 8 and ground.
    - **If less than 4.8 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the 5 V reference circuit terminal 8 X9 and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for infinite resistance between the 5 V reference circuit terminal 5 X2 and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    4. Test for less than 2 Ω in the 5 V reference circuit terminal 8 X9 end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 5.2 V or greater**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the 5 V reference circuit terminal 8 X9 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 1 V between the 5 V reference circuit terminal 5 X2 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If within the specified range**
5. Test for less than 1 V between the signal circuit terminal 11 and ground.
    - **If 1 V or greater**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If between 1 - 5 V, repair the short to voltage on the circuit.
        - If greater than 5 V, repair the short to voltage on the circuit and replace the T24 Battery Charger - DC.
        - If less than 1 V
    3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
    4. Verify that DTC P3002, P3003, P301F, or P3020 does not set while operating the vehicle within the Conditions for Running the DTC.
        - If any of the DTCs are set, replace the T24 Battery Charger - DC.
        - If none of the DTCs are set
    5. All OK.
    - **If less than 1 V**

6. Vehicle OFF, install a 3 A fused jumper wire between the signal circuit terminal 11 and the 5 V reference circuit terminal 8. Vehicle in Service Mode.
7. Verify the scan tool DC Negative Supply Isolation Voltage parameter is greater than 500 V.
    - **If less than 500 V**
    1. Test for infinite resistance between the signal circuit and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    2. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 500 V or greater**
8. Replace the T24 Battery Charger - DC.

DTC P300B: HYBRID/EV BATTERY DC CHARGING OUTPUT CURRENT PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P300B

Hybrid/EV Battery DC Charging Output Current Performance

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors for normal operation and regular (AC) charging, and 1 module. In vehicles with DC charging capability, there are two additional DC contactors that are housed in the battery charger - DC. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or safely contain the high voltage DC within the hybrid/EV battery assembly. The 6 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, AC charge positive high voltage contactor, precharge contactor, DC positive contactor, and DC negative contactor. The 1 module is the hybrid/EV battery pack coolant heater module. The contactors and module close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage contactors/module. Ground is provided through the case ground and chassis.

The hybrid/EV powertrain control module 2 measures internal voltages, currents, and temperatures within the battery charger - DC and charge receptacle and verifies they are within the proper range.

Conditions for Running the DTC

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The Charge Control Mode is Constant current or Constant Voltage.
- The Battery Charger DC positive and negative contactors are closed.
- The Battery Pack main positive, main negative, and multifunction contactors are closed.
- The Charge Power Level is DC.
- DTCs P0AC1, P0AC2 and P1EBA are not set.

Conditions for Setting the DTC

The percent current deviation is greater than the fail threshold for 80% of the samples in a 10 s window. The fail thresholds are as follows:

- 100% current deviation when the commanded current is less than 5 A
- 60% current deviation when the commanded current is greater than or equal to 5 A and less than 20 A
- 50% current deviation when the commanded current is greater than or equal to 20 A and less than 40 A
- 30% current deviation when the commanded current is greater than or equal to 40 A

Action Taken When the DTC Sets

DTC P300B is a type C DTC.

Conditions for Clearing the DTC

DTC P300B is a type C DTC.

Diagnostic Aids

Current deviation is defined as actual current minus commanded current. Percent current deviation is defined as current deviation divided by commanded current multiplied by 100. For example, if commanded current is 10 A and actual current is 18 A, the current deviation is 8 A and the percent current deviation is 80%. An 80% current deviation is greater than the 60% fail threshold for the 5 A to 20 A commanded current range.

Circuit/System Verification

1. Verify that DTC P300B does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If DTC P300B is set**

      Contact the GM Technical Assistance Center to report a DC Fast charge station problem.

    - **If DTC P300B is not set**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P300C, P300D, OR P300F: HYBRID/EV BATTERY DC CHARGING PORT TEMPERATURE SENSOR CIRCUIT LOW/HIGH/ERRATIC

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P300C

Hybrid/EV Battery DC Charging Port Temperature Sensor Circuit Low

DTC P300D

Hybrid/EV Battery DC Charging Port Temperature Sensor Circuit High

DTC P300F

Hybrid/EV Battery DC Charging Port Temperature Sensor Circuit Erratic

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the receptacle temperature any time the hybrid/EV powertrain control module 2 is awake. The hybrid/EV powertrain control module 2 verifies the temperature signal is within the proper range.

Conditions for Running the DTC

P300C and P300D

The vehicle 12 V battery system voltage is greater than 10.2 V.

P300F

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- DTC P300C or P300D is not set.

Conditions for Setting the DTC

P300C

The charging port temperature sensor signal percent is less than 2.5% in 1 s.

P300D

The charging port temperature sensor signal percent is greater than 99.0% in 1 s.

P300F

The hybrid/EV powertrain control module 2 detects the charging port temperature sensor signal is erratic for 10 seconds.

Action Taken When the DTC Sets

DTC P300C, P300D, and P300F are type A DTCs.

Conditions for Clearing the DTC

- DTC P300C, P300D, and P300F are type A DTCs.

Circuit/System Verification

1. Vehicle in Service Mode.

   NOTE: **The DC Charge Port Temperature should be close to ambient temperature without the cord set plugged in.**

2. Observe the scan tool DC Charge Port Temperature parameter. The reading should be between -40 and +125Ã‚Â° C (-40 and +257Ã‚Â° F).
   - **The reading is not within the specified range**

     Refer to Circuit/System Testing.

   - **The reading is within the specified range**
3. Verify that DTC P300C, P300D, or P300F does not set while operating the vehicle within the Conditions for Running the DTC.
   - **If any of the DTCs are set**

     Refer to Circuit/System Testing.

   - **If none of the DTCs are set**
4. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. Disconnect the X2 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference terminal 6 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.

4. Test for 4.8 - 4.95 V between the signal circuit terminal 5 and ground.
   - **If less than 4.8 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the signal circuit and ground
      - If less infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If greater than 4.95 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If between 1 - 5.2 V, repair the short to voltage on the circuit.
      - If greater than 5.2 V, repair the short to voltage on the circuit and replace the X98 Hybrid/EV Battery Charger Receptacle.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If between 4.8 - 4.95 V**
5. Replace the X98 Hybrid/EV Battery Charger Receptacle.

Component Testing

1. Vehicle OFF and all vehicle systems OFF. Disconnect the X2 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.
2. Test for 2.76 - 2.93k Ω at approximately 25Ã‚Â°C (77Ã‚Â°F) between the signal terminal 5 and the low reference terminal 6.
   - **If not within the specified range**

     Replace the X98 Hybrid/EV Battery Charger Receptacle.

   - **If within the specified range**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)Drive Motor Battery Charger Receptacle Replacement (Dubai only with quick charge)Drive Motor Battery Charger Receptacle Replacement (Dubai only without quick charge)**

DTC P3010, P3013, OR P3014: HYBRID/EV BATTERY DC CHARGING PORT LOCK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P3010

Hybrid/EV Battery DC Charging Port Lock Control Circuit

DTC P3013

Hybrid/EV Battery DC Charging Port Lock Stuck Open

DTC P3014

Hybrid/EV Battery DC Charging Port Lock Stuck Closed

Circuit/System Description

The hybrid/EV powertrain control module 2 activates the charge port lock to prevent the DC charge cord from being disconnected during charging. The hybrid/EV powertrain control module 2 monitors the charge port lock any time the hybrid/EV powertrain control module 2 is awake. The hybrid/EV powertrain control module 2 monitors the command and the actuator position to verify proper operation.

Conditions for Running the DTC

P3010

The charge port lock actuator has been commanded to LOCK or UNLOCK.

P3013 and P3014

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The charge port lock actuator has not been commanded for more than 2 sec.
- DTC P302B, P302C, or P302D is not set.

Conditions for Setting the DTC

P3010

- The hybrid/EV powertrain control module 2 has detected a lock driver open circuit fault.

  OR

- The hybrid/EV powertrain control module 2 has detected a lock driver short circuit fault.

P3013

- The charge port lock actuator has been commanded to LOCK.
- The hybrid/EV powertrain control module 2 has determined a stuck open condition by comparing the charge port lock commanded lock position to the DC Charge Port Lock Actuator Engaged Position.

P3014

- The charge port lock actuator has been commanded to UNLOCK.
- The hybrid/EV powertrain control module 2 has determined a stuck closed condition by comparing the charge port lock commanded unlock position to the DC Charge Port Lock Actuator Disengaged Position.

Action Taken When the DTC Sets

DTC P3010, P3013, and P3014 are type C DTCs.

Conditions for Clearing the DTC

DTC P3010, P3013, and P3014 are type C DTCs.

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Command the DC Charge Port Lock to LOCK and UNLOCK with a scan tool while listening for the DC Charge Port Lock to lock and unlock. The DC Charge Port Lock should lock and unlock and the scan tool DC Charge Port Lock Actuator Position Sensor parameter should change between 0.15 - 4.85 V.
    - **If the DC Charge Port Lock does not LOCK or UNLOCK or the DC Charge Port Lock Actuator Position Sensor parameter does not change**

      Refer to Circuit/System Testing.

    - **If the DC Charge Port Lock does LOCK and UNLOCK and the DC Charge Port Lock Actuator Position Sensor parameter changes**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. Disconnect the X2 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. Connect a test lamp between the control circuit terminal 7 and ground. Vehicle in Service Mode.
2. Verify the test lamp illuminates.
    - **If the test lamp does not illuminate or is very Dim**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control circuit terminal 7 and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit terminal 7 end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp does illuminate**
3. Command the DC Charge Port Lock to LOCK and UNLOCK with a scan tool. Verify that the test lamp turns ON and OFF.
    - **If the test lamp does not turn OFF or Dims**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal 7 and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp turns ON and OFF**

4. Disconnect the test lamp. Connect a test lamp between the control circuit terminal 8 and ground.
   - **If the test lamp does not illuminate or is very Dim**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the control circuit terminal 8 and ground.
      - If less infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp does illuminate**
5. Command the DC Charge Port Lock to UNLOCK and LOCK with a scan tool. Verify that the test lamp turns ON and OFF.
   - **If the test lamp does not turn OFF or Dims**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal 8 and ground.
      - If 1 V or greater, repair the short to voltage in the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp turns ON and OFF**
6. Replace the X98 Hybrid/EV Battery Charger Receptacle.

Circuit/System Description

In vehicles with quick charge DC charging capability, RPO: CBT, there are two high voltage contactors that are housed in the T24 battery charger - DC. These additional high voltage contactors allow the high voltage DC batteries to be connected to the X98 Hybrid/EV Battery Charger Receptacle DC charge terminals.

The hybrid/EV powertrain control module 2 measures internal voltages, currents, and temperatures within the T24 battery charger - DC and charge receptacle and verifies they are within the proper range.

Conditions for Running the DTC

P3015 and P3018

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The hybrid/EV battery current is less than 999 A.

P301C

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The main positive and negative contactors are CLOSED.
- The DC charging positive contactor is OPEN.

P301D

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The main positive and negative contactors are CLOSED.
- The DC charging negative contactor is OPEN.

Conditions for Setting the DTC

P3015

- The DC charging positive contactor is commanded OPEN and the output voltage is greater than battery voltage minus 0.4 V.

  OR

- The DC charging positive contactor is commanded CLOSED and the current sense feedback is less than 194 mA.

P3018

- The DC charging negative contactor is commanded OPEN and the output voltage is greater than battery voltage minus 0.4 V.

  OR

- The DC charging negative contactor is commanded CLOSED and the current sense feedback is less than 194 mA.

P301C

The DC charging positive bus voltage is within 80% to 120% of the hybrid/EV powertrain control module 1 positive bus voltage.

P301D

The DC charging negative bus voltage is within 80% to 120% of the hybrid/EV powertrain control module 1 negative bus voltage.

Action Taken When the DTC Sets

DTC P3015, P3018, P301C and P301D are type B DTCs.

Conditions for Clearing the DTC

DTC P3015, P3018, P301C and P301D are type B DTCs.

Control Module References for scan tool information

Circuit/System Verification

NOTE: **The following setup steps MUST BE PERFORMED EXACTLY in order to exercise the contactors.**

1. Vehicle OFF. Turn ON the park lamps.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode or Vehicle ON.**

NOTE: **There are two contactor control functions available on the scan tool. Make sure you select the DC charging contactor control and not the battery contactor control.**

2. Command the hybrid powertrain control module 2, Hybrid/EV Battery DC Charging Contactors ALL OPEN with a scan tool.

NOTE: **Ignore DTC P0ABC after pulling the S15 Manual Service Disconnect.**

3. Disconnect the S15 Manual Service Disconnect.

NOTE: **DO NOT use the scan tool Release Control button to turn OFF any of the**

contactors. Once the scan tool Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning, including reinstalling the S15 Manual Service Disconnect and clearing DTCs.

4. Command the Hybrid/EV Battery DC Charging Negative Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to open.

NOTE: **It is normal for the charging contactors to only make noise while opening.**

5. Verify the Hybrid/EV Battery DC Charging Negative Contactor is heard opening.
   - **If the Hybrid/EV Battery DC Charging Negative Contactor operation cannot be heard**

     Refer to Hybrid/EV Battery DC Charging Negative Contactor.

   - **If the Hybrid/EV Battery DC Charging Negative Contactor operation can be heard**
6. Command the Hybrid/EV Battery DC Charging Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to open.
7. Verify the Hybrid/EV Battery DC Charging Positive Contactor is heard opening.
   - **If the Hybrid/EV Battery DC Charging Positive Contactor operation cannot be heard**

     Refer to Hybrid/EV Battery DC Charging Positive Contactor.

   - **If the Hybrid/EV Battery DC Charging Positive Contactor operation can be heard**

NOTE: **It is normal for the Hybrid/EV Battery DC Charging Negative Contactor to be slightly quieter than the positive contactor.**

8. Repeat opening and closing of both DC Charging contactors several times while comparing the sound made by each contactor.
   - **If either contactor intermittently stops working**

     Replace the T24 Battery Charger - DC

   - **If both contactors consistently generate sound**
9. All OK.

Circuit/System Testing

Hybrid/EV Battery DC Charging Negative Contactor

1. Vehicle OFF. Disconnect the X9 harness connector at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between the ground circuit terminals listed below and ground.
   - Terminal 1
   - Terminal 3
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Connect the X9 harness connector at the T24 Battery Charger - DC.

NOTE: **The following setup steps MUST BE PERFORMED EXACTLY in order to exercise the contactor.**

4. Vehicle OFF, turn ON the park lamps.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode or Vehicle ON.**

5. Command the Hybrid/EV Battery DC Charging Contactors ALL OPEN with a scan tool.

NOTE: **Ignore P0ABC after pulling the S15 Manual Service Disconnect.**

6. Disconnect the S15 Manual Service Disconnect. Disconnect the X9 harness connector at the T24 Battery Charger - DC. Connect a test lamp between the control circuit terminal 4 and ground.
7. Verify that the test lamp is OFF.
   - **If the test lamp is ON**
   1. Vehicle OFF, turn OFF the park lamps. Remove the test lamp. Disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.
   - **If the test lamp is OFF**

NOTE: **DO NOT use the scan tool Release Control button to turn OFF the contactor. Once the scan tool Release Control button is pushed the setup steps will need to be restarted from the beginning.**

8. Command the Hybrid/EV Battery DC Charging Negative Contactor CLOSED and ALL OPEN with a scan tool. Verify that the test lamp turns ON and OFF.
   - **If the test lamp does not turn ON and OFF**
   1. Vehicle OFF, turn OFF the park lamps. Remove the test lamp. Disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.
   2. Test for infinite resistance between control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid Powertrain Control Module 2.
   - **If the test lamp does turn ON and OFF**
9. Replace the T24 Battery Charger - DC.

Hybrid/EV Battery DC Charging Positive Contactor

1. Vehicle OFF. Disconnect the X9 harness connector at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between the ground circuit terminals listed below and ground.
   - Terminal 1
   - Terminal 3
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Connect the X9 harness connector at the T24 Battery Charger - DC.

NOTE: **The following setup steps MUST BE PERFORMED EXACTLY in order to exercise the contactor.**

4. Vehicle OFF, turn ON the park lamps.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode or Vehicle ON.**

5. Command the Hybrid/EV Battery DC Charging Contactors ALL OPEN with a scan tool.

   NOTE: **Ignore P0ABC after pulling the S15 Manual Service Disconnect.**

6. Disconnect the S15 Manual Service Disconnect. Disconnect the X9 harness connector at the T24 Battery Charger - DC. Connect a test lamp between the control circuit terminal 2 and ground.

   NOTE: **DO NOT use the scan tool Release Control button to turn OFF the contactor. Once the scan tool Release Control button is pushed the setup steps will need to be restarted from the beginning.**

7. Verify that the test lamp is OFF.
   - **If the test lamp is ON**
   1. Vehicle OFF, turn OFF the park lamps. Remove the test lamp. Disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is OFF**
8. Command the Hybrid/EV Battery DC Charging Positive Contactor CLOSED and ALL OPEN with a scan tool.
9. Verify that the test lamp turns ON and OFF.
   - **If the test lamp does not turn ON and OFF**
   1. Vehicle OFF, turn OFF the park lamps. Remove the test lamp. Disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp does turn ON and OFF**
10. Replace the T24 Battery Charger - DC.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for T24 battery charger - DC and hybrid/EV powertrain control module 2 replacement, programming, and setup.

DTC P301E: HYBRID/EV BATTERY DC CHARGING CONTACTORS OPENED UNDER LOAD - DC CHARGING DISABLED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P301E

Hybrid/EV Battery DC Charging Contactors Opened Under Load - DC Charging Disabled

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors for normal operation and regular (AC) charging, and 1 module. In vehicles with DC charging capability, there are two additional DC contactors that are housed in the battery charger - DC. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or safely contain the high voltage DC within the hybrid/EV battery assembly. The 6 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, AC charge positive high voltage contactor, precharge contactor, DC positive contactor, and DC negative contactor. The 1 module is the hybrid/EV battery pack coolant heater module. The contactors and module close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage contactors/module. Ground is provided through the case ground and chassis.

The hybrid/EV powertrain control module 2 measures internal voltages, currents, and temperatures within the battery charger - DC and charge receptacle and verifies they are within the proper range. During DC charging the hybrid/EV powertrain control module 2 monitors for the charging cable being disconnected while under load during DC charging.

Conditions for Running the DTC

The charge current is greater than 5 A for 12.5 ms.

Conditions for Setting the DTC

The accumulated current when DC charging contactors are opened is greater than 30, 000 A.

Action Taken When the DTC Sets

DTC P301E is a type A DTC.

Conditions for Clearing the DTC

- DTC P301E is a type A DTC.
- The **DC Charging Disabled Reset** function must be performed with a scan tool before clear codes

Circuit/System Verification

1. Vehicle in Service Mode.

NOTE: **The DC Charge Port Temperature should be close to ambient temperature without the cord set plugged in.**

2. Observe the scan tool DC Charge Port Temperature parameter. The reading should be between -40 and +125Ã,Â° C (-40 and +257Ã,Â° F).
    - **The reading is not within the specified range**

      Refer to Circuit/System Testing.

    - **The reading is within the specified range**

NOTE: **Damage can include cracks, breaks, bent pins or missing parts.**

3. Vehicle OFF. Visually inspect the X98 Hybrid/EV Battery Charger Receptacle and high voltage cables for damage.
    - **The receptacle or cables are damaged**

      Replace the X98 Hybrid/EV Battery Charger Receptacle.

    - **The receptacle and cables are visually OK**
4. Verify that DTC P301F does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If the DTC is set**

      Contact the GM Technical Assistance Center to report a DC Charge Station problem.

    - **If the DTC is not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. Disconnect the X2 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference terminal 6 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 4.95 V between the signal circuit terminal 5 and ground.
    - **If less than 4.8 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the signal circuit and ground
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If greater than 4.95 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If between 1 - 5.2 V, repair the short to voltage on the circuit.

        - If greater than 5.2 V, repair the short to voltage on the circuit and replace the X98 Hybrid/EV Battery Charger Receptacle.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If between 4.8 - 4.95 V**
5. Replace the X98 Hybrid/EV Battery Charger Receptacle.

Component Testing

1. Vehicle OFF and all vehicle systems OFF. Disconnect the X2 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.
2. Test for 2.76 - 2.93k Ω at approximately 25Ã‚Â°C (77Ã‚Â°F) between the signal terminal 5 and the low reference terminal 6.
    - **If not within the specified range**

      Replace the X98 Hybrid/EV Battery Charger Receptacle.

    - **If within the specified range**
3. All OK.

DTC P3027-P302A: CHARGE PORT LOCK POSITION SENSOR (DUBAI)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P3027

Charge Port Lock Position Sensor Performance - Signal Low

DTC P3028

Charge Port Lock Position Sensor Performance - Signal High

DTC P3029

Charge Port Lock Position Sensor Performance

DTC P302A

Charge Port Lock Actuator Position Sensor Not Plausible

Circuit/System Description

The hybrid/EV powertrain control module 2 activates the charge port lock to prevent the DC charge cord from being disconnected during charging. The hybrid/EV powertrain control module 2 monitors the charge port lock any time the hybrid/EV powertrain control module 2 is awake. The hybrid/EV powertrain control module 2 monitors the command and the actuator position to verify proper operation.

Conditions for Running the DTC

P3027 and P3028

The vehicle 12 V battery system voltage is greater than 10.2 V.

P3029

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The charge port lock actuator has been commanded to LOCK for greater than 2 s.

P302A

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The charge port lock actuator has been commanded to LOCK for greater than 2 s.
- None of the following DTCs are set: P3027, P3028, P3029, P302B, P302C, P302D.

Conditions for Setting the DTC

P3027

The hybrid/EV powertrain control module 2 detects the charge port lock position sensor signal is out of range low. The signal is less than 22.94% of range for 4 s.

P3028

The hybrid/EV powertrain control module 2 detects the charge port lock position sensor signal is out of range high. The signal is greater than 94.50% of range for 4 s.

P3029

The hybrid/EV powertrain control module 2 detects the charge port lock position sensor signal is not within a valid range. The signal is within 65.80% to 81.56% of range for 4 s.

P302A

The hybrid/EV powertrain control module 2 detects the charge port lock actuator position sensor signal does not match the charge port lock position sensor signal for 8 s.

Action Taken When the DTC Sets

DTC P3027, P3028, P3029, and P302A are Type C DTCs.

Conditions for Clearing the DTC

DTC P3027, P3028, P3029, and P302A are Type C DTCs.

Circuit/System Verification

1. Vehicle in Service Mode. With a scan tool command the DC Charge Port Lock between UNLOCK and LOCK.
2. Observe the scan tool DC Charge Port Lock Position Sensor parameter. The value should change between 4.08 - 4.73 V (UNLOCKED) and 1.15 - 3.29 V (LOCKED).
    - **The value is not within the specified ranges**

      Refer to Circuit/System Testing.

    - **The value is within the specified ranges**
3. Begin charging using a DC Fast Charge station. Wait 1 minute. Stop charging and remove plug. Verify that P3027 - P302A is not set.
    - **If any of the DTCs are set**

      Refer to Circuit/System Testing.

    - **If none of the DTCs are set**
4. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. Disconnect the X2 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.
2. Test for 1.15 V or greater between the signal circuit terminal 4 and ground.
    - **If less than 1.15 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the signal circuit terminal 4 and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit terminal 4 end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω
    4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 1.15 V or greater**
3. Command the DC Charge Port Lock to LOCK with a scan tool. Test for 3.29 V or less between the signal circuit terminal 4 and ground.
    - **If greater than 3.29 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 4 and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V
    3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 3.29 V or less**
4. Replace the X98 Hybrid/EV Battery Charger Receptacle.

DTC P302B-P302D: CHARGE PORT LOCK ACTUATOR POSITION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P302B

Charge Port Lock Actuator Position Sensor Signal Out of Range Low

DTC P302C

Charge Port Lock Actuator Position Sensor Signal Out of Range High

DTC P302D

Charge Port Lock Actuator Position Sensor Circuit Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 activates the charge port lock to prevent the DC charge cord from being disconnected during charging. The hybrid/EV powertrain control module 2 monitors the charge port lock any time the hybrid/EV powertrain control module 2 is awake. The hybrid/EV powertrain control module 2 monitors the command and the actuator position to verify proper operation.

Conditions for Running the DTC

P302B and P302C

The vehicle 12 V battery system voltage is greater than 10.2 V.

P302D

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The charge port lock actuator has been commanded to LOCK for greater than 2 s.

Conditions for Setting the DTC

P302B

The hybrid/EV powertrain control module 2 detects the charge port lock actuator position sensor signal is out of range low. The signal is less than 3% of range for 4 s.

P302C

The hybrid/EV powertrain control module 2 detects the charge port lock actuator position sensor signal is out of range high. The signal is greater than 97% of range for 4 s.

P302D

The hybrid/EV powertrain control module 2 detects the charge port lock actuator position sensor signal is not within a valid range. The signal is within 35% to 75% of range for 4 s.

Action Taken When the DTC Sets

DTC P302B, P302C, and P302D are type C DTCs.

Conditions for Clearing the DTC

DTC P302B, P302C, and P302D are type C DTCs.

Circuit/System Verification

1. Vehicle in Service Mode. Depress the receptacle switch with a small screw driver. With a scan command the DC Charge Port Lock between UNLOCK and LOCK.

   NOTE: **If the receptacle switch is not fully depressed the reading will remain below 2 V.**

2. Observe the scan tool DC Charge Port Lock Actuator Position Sensor parameter. The reading should change between 0.15 - 1.75 V (UNLOCKED) and 3.75 - 4.85 V (LOCKED).
   - **The reading are not within the specified ranges**

     Refer to Circuit/System Testing.

   - **The reading are within the specified ranges**
3. Verify that DTC P302B, P302C, or P302D is not set.
   - **If any of the DTCs are set**

     Refer to Circuit/System Testing.

   - **If none of the DTCs are set**
4. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. Disconnect the X2 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference terminal 3 and ground.
   - **If 10 Ω or greater**

    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
    - **If less than 4.8 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If greater than 5.2 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If between 4.8 - 5.2 V**
5. Verify the scan tool DC Charge Port Lock Actuator Position Sensor parameter is less than 0.5 V.
    - **If 0.5 V or greater**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 2 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than 0.5 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the 5 V reference circuit terminal 1.
7. Verify the scan tool DC Charge Port Lock Actuator Position Sensor parameter is greater than 4.95 V.
    - **If 4.95 V or less**
    1. Vehicle OFF, remove the jumper wire. Disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If greater than 4.95 V**
8. Replace the X98 Hybrid/EV Battery Charger Receptacle.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Battery Charger Receptacle Replacement (Dubai only with quick charge)Drive Motor Battery Charger Receptacle Replacement (Dubai only without quick charge)**

- **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming, and setup.

DTC P302F: HYBRID/EV BATTERY DC CHARGING SYSTEM ISOLATION FAULT (NORTH AMERICA, KOREA)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P302F

Hybrid/EV Battery DC Charging System Isolation Fault

Circuit/System Description

In vehicles with quick charge DC charging capability, RPO CBT, there are two high voltage contactors housed within the T24 battery charger - DC. These additional high voltage contactors allow the high voltage DC batteries to be connected to the X98 Hybrid/EV Battery Charger Receptacle DC charge terminals.

The hybrid/EV powertrain control module 2 measures a high impedance network within the T24 battery charger - DC to verify isolation between the DC high voltage positive and negative circuits and the vehicle chassis are within the proper range.

Conditions for Running the DTC

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The DC charge cable is connected.
- The vehicle is charging.
- The battery charger - DC positive contactor is commanded CLOSED.
- The battery charger - DC negative contactor is commanded CLOSED.
- DTC P3002, P3003, P3005, P3006, P301F, P3020, P3021, or P3022 is not set.

OR

- The vehicle 12 V battery system voltage is greater than 10.2 V.
- The DC charge cable is connected.
- The charge mode is precharge.
- The battery charger - DC positive contactor is commanded OPEN.
- The battery charger - DC negative contactor is commanded OPEN.
- The difference between the sum of DC charger positive and negative voltage sensors and the battery voltage is less than 45 V for 2 s.
- DTC P3002, P3003, P3005, P3006, P301F, P3020, P3021, or P3022 is not set.

Conditions for Setting the DTC

The ratio between DC negative supply isolation voltage and DC positive supply isolation voltage is greater than 19.

Action Taken When the DTC Sets

DTC P302F is type A DTC.

Conditions for Clearing the DTC

DTC P302F is type A DTC.

Diagnostic Aids

- A single high voltage contactor stuck closed may set DTC P302F.

- Condensation or water intrusion into the battery charger - DC may cause DTC P302F to set.
- A vehicle-level loss of isolation concern may cause DTC P302F to set.

Circuit/System Verification

1. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE2, P0AE4, P0D0A, P0D11, P1EBC, P1EBE-P1EC0, P1EC3-P1EC5, P1AF0, P1AF4, P1AF5, P1E1B-P1E1F, P1E20-P1E22, P1B0B, P1B0C, P3002, P3003, P3005, P3006, P3015, P3018, P301B-P301F, P3020, P3021, or P3022 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
2. Remove all vehicle chargers.
3. Vehicle ON.
4. Observe the scan tool hybrid powertrain control module 2 DC Negative Supply Isolation Voltage parameter. The reading should be 0 V.
    - **If greater than 0 V**

      NOTE: **The following setup steps MUST BE PERFORMED EXACTLY in order to exercise the contactors.**

      1. Vehicle OFF. Turn ON the park lamps.
      2. DO NOT press the power button and enter Vehicle in Service Mode or Vehicle ON.

      NOTE: **There are two contactor control functions available on the scan tool. Make sure you select the DC charging contactor control and not the battery contactor control.**

      3. Command the Hybrid/EV Battery DC Charging Contactors ALL OPEN with a scan tool.

      NOTE: **Ignore P0ABC after pulling the S15 Manual Service Disconnect.**

4. Disconnect the S15 Manual Service Disconnect.
5. DO NOT use the scan tool Release Control button to turn OFF any of the contactors. Once the scan tool Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning including reinstalling the S15 Manual Service Disconnect and clearing DTCs.
6. Command the Hybrid/EV Battery DC Charging Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to open.

NOTE: **It is normal for the charging contactors to only make noise while opening.**

7. Verify the Hybrid/EV Battery DC Charging Positive Contactor is heard opening.
    - If the Hybrid/EV Battery DC Charging Positive Contactor operation cannot be heard, refer to Circuit/System Testing, Hybrid/EV Battery DC Charging Positive Contactor.
    - If the Hybrid/EV Battery DC Charging Positive Contactor operation is heard, refer to Circuit/System Testing, Hybrid/EV Battery DC Charging Negative Voltage Sensor.

- **If 0 V**

5. Observe the scan tool hybrid powertrain control module 2 DC Positive Supply Isolation Voltage parameter. The reading should be 0 V.
    - **If greater than 0 V**

    NOTE: **The following setup steps MUST BE PERFORMED EXACTLY in order to exercise the contactors.**

    1. Vehicle OFF. Turn ON the park lamps.
    2. DO NOT press the power button and enter Vehicle in Service Mode or Vehicle ON.

    NOTE: **There are two contactor control functions available on the scan tool. Make sure you select the DC charging contactor control and not the battery contactor control.**

    3. Command the Hybrid/EV Battery DC Charging Contactors ALL OPEN with a scan tool.

    NOTE: **Ignore P0ABC after pulling the S15 Manual Service Disconnect.**

    4. Disconnect the S15 Manual Service Disconnect.
    5. DO NOT use the scan tool Release Control button to turn OFF any of the contactors. Once the scan tool Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning including reinstalling the S15 Manual Service Disconnect and clearing DTCs.
    6. Command the Hybrid/EV Battery DC Charging Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to open.

    NOTE: **It is normal for the charging contactors to only make noise while opening.**

    7. Verify the Hybrid/EV Battery DC Charging Positive Contactor is heard opening.
        - If the Hybrid/EV Battery DC Charging Negative Contactor operation cannot be heard, refer to Circuit/System Testing, Hybrid/EV Battery DC Charging Negative Contactor.
        - If the Hybrid/EV Battery DC Charging Negative Contactor operation is heard, refer to Circuit/System Testing, Hybrid/EV Battery DC Charging Positive Voltage Sensor.

    - **If 0 V**

6. Refer to Circuit/System Testing, DC Charging System Isolation Fault.

Circuit/System Testing

Hybrid/EV Battery DC Charging Negative Voltage Sensor

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down. Disconnect the X9 harness connector at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between the ground circuit terminal 9 and ground.

   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 8 and ground.
   - **If less than 4.8 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the 5 V reference circuit terminal 8 X9 and ground.
      - If less infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for infinite resistance between the 5 V reference circuit terminal 5 X2 and ground.
      - If less infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   4. Test for less than 2 Ω in the 5 V reference circuit terminal 8 X9 end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If 5.2 V or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the 5 V reference circuit terminal 8 X9 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 1 V between the 5 V reference circuit terminal 5 X2 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If within the specified range**
5. Test for less than 1 V between the signal circuit terminal 11 X9 and ground.
   - **If 1 V or greater**
   1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If between 1 - 5 V, repair the short to voltage on the circuit.
      - If greater than 5 V, repair the short to voltage on the circuit and replace the T24 Battery Charger - DC.
      - If less than 1 V
   3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
   4. Verify that DTC P3002, P3003, P301F, or P3020 does not set while operating the vehicle within the Conditions for Running the DTC.
      - If any of the DTCs are set, replace the T24 Battery Charger - DC.
      - If none of the DTCs are set
   5. All OK.
   - **If less than 1 V**
6. Vehicle OFF, install a 3 A fused jumper wire between the signal circuit terminal 11 and the 5 V reference circuit terminal 8. Vehicle in Service Mode.
7. Verify the scan tool DC Negative Supply Isolation Voltage parameter is greater than 500 V.
   - **If less than 500 V**

   1. Test for infinite resistance between the signal circuit and ground.
      - If less infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   2. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If 500 V or greater**

8. Replace the T24 Battery Charger - DC.

Hybrid/EV Battery DC Charging Positive Voltage Sensor

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down. Disconnect the X9 harness connector at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between the ground circuit terminal 9 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 8 and ground.
   - **If less than 4.8 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the 5 V reference circuit terminal 8 X9 and ground.
      - If less infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for infinite resistance between the 5 V reference circuit terminal 5 X2 and ground.
      - If less infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   4. Test for less than 2 Ω in the 5 V reference circuit terminal 8 X9 end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If 5.2 V or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the 5 V reference circuit terminal 8 X9 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 1 V between the 5 V reference circuit terminal 5 X2 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If within the specified range**
5. Test for less than 1 V between the signal circuit terminal 10 X9 and ground.
   - **If 1 V or greater**
   1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If between 1 - 5 V, repair the short to voltage on the circuit.

        - If greater than 5 V, repair the short to voltage on the circuit and replace the T24 Battery Charger - DC.
        - If less than 1 V
    3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
    4. Verify that DTC P3002, P3003, P301F, or P3020 does not set while operating the vehicle within the Conditions for Running the DTC.
        - If any of the DTCs are set, replace the T24 Battery Charger - DC.
        - If none of the DTCs are set
    5. All OK.
    - **If less than 1 V**
6. Vehicle OFF, install a 3 A fused jumper wire between the signal circuit terminal 10 and the 5 V reference circuit terminal 8. Vehicle in Service Mode.
7. Verify the scan tool DC Positive Supply Isolation Voltage parameter is greater than 500 V.
    - **If less than 500 V**
    1. Test for infinite resistance between the signal circuit and ground.
        - If less infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    2. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 500 V or greater**
8. Replace the T24 Battery Charger - DC.

Hybrid/EV Battery DC Charging Negative Contactor

1. Vehicle OFF. Disconnect the X9 harness connector at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between the ground circuit terminals listed below and ground.
    - Terminal 1
    - Terminal 3
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect the X9 harness connector at the T24 Battery Charger - DC.

NOTE: **The following setup steps MUST BE PERFORMED EXACTLY in order to exercise the contactor.**

4. Vehicle OFF, turn ON the park lamps.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode or Vehicle ON.**

5. Command the Hybrid/EV Battery DC Charging Contactors ALL OPEN with a scan tool.

NOTE: **Ignore P0ABC after pulling the S15 Manual Service Disconnect.**

6. Disconnect the S15 Manual Service Disconnect. Disconnect the X9 harness connector at the T24 Battery Charger - DC. Connect a test lamp between the control circuit terminal 4 and ground.
7. Verify that the test lamp is OFF.
    - **If the test lamp is ON**

1. Vehicle OFF, turn OFF the park lamps. Remove the test lamp. Disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.

- **If the test lamp is OFF**

NOTE: **DO NOT use the scan tool Release Control button to turn OFF the contactor. Once the scan tool Release Control button is pushed the setup steps will need to be restarted from the beginning.**

8. Command the Hybrid/EV Battery DC Charging Negative Contactor CLOSED and ALL OPEN with a scan tool. Verify that the test lamp turns ON and OFF.
    - **If the test lamp does not turn ON and OFF**
    1. Vehicle OFF, turn OFF the park lamps. Remove the test lamp. Disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.
    2. Test for infinite resistance between control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid Powertrain Control Module 2.
    - **If the test lamp does turn ON and OFF**
9. Replace the T24 Battery Charger - DC.

Hybrid/EV Battery DC Charging Positive Contactor

1. Vehicle OFF. Disconnect the X9 harness connector at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between the ground circuit terminals listed below and ground.
    - Terminal 1
    - Terminal 3
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect the X9 harness connector at the T24 Battery Charger - DC.

NOTE: **The following setup steps MUST BE PERFORMED EXACTLY in order to exercise the contactor.**

4. Vehicle OFF, turn ON the park lamps.

NOTE: **DO NOT press the power button and enter Vehicle in Service Mode or Vehicle ON.**

5. Command the Hybrid/EV Battery DC Charging Contactors ALL OPEN with a scan tool.

NOTE: **Ignore P0ABC after pulling the S15 Manual Service Disconnect.**

6. Disconnect the S15 Manual Service Disconnect. Disconnect the X9 harness connector at the T24 Battery Charger - DC. Connect a test lamp between the control circuit terminal 2 and ground.

NOTE: **DO NOT use the scan tool Release Control button to turn OFF the contactor. Once the scan tool Release Control button is pushed the setup steps will need**

to be restarted from the beginning.

7. Verify that the test lamp is OFF.
   - **If the test lamp is ON**
   1. Vehicle OFF, turn OFF the park lamps. Remove the test lamp. Disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is OFF**
8. Command the Hybrid/EV Battery DC Charging Positive Contactor CLOSED and ALL OPEN with a scan tool.
9. Verify that the test lamp turns ON and OFF.
   - **If the test lamp does not turn ON and OFF**
   1. Vehicle OFF, turn OFF the park lamps. Remove the test lamp. Disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp does turn ON and OFF**
10. Replace the T24 Battery Charger - DC.

DC Charging System Isolation Fault

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Perform the Circuit/System Verification steps of the Loss of Isolation on the High Voltage Main Bus procedure.
   - **If the Circuit/System Verification steps identify a vehicle-level loss of isolation concern**

Repair vehicle as applicable.

- **If the Circuit/System Verification steps do not identify a vehicle-level loss of isolation concern**

2. Vehicle OFF, disable the high voltage. Refer to High Voltage Disabling .

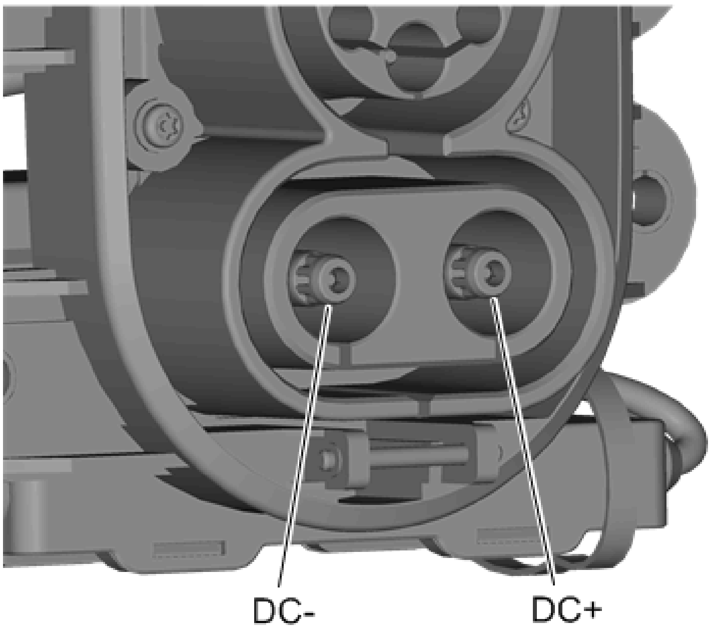

Fig. 13: Terminal DC- And DC+
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Only perform the following continuity tests using the EL-50772 Insulation Multimeter or equivalent.**

NOTE: **Unlike other HV components in the system, the DC charge terminals of the T24 Battery Charger - DC should not be tested at the 500 V range.**

3. Ensure only the **EL-50772** Insulation Multimeter or equivalent is used with this procedure. Select the Isolation Test setting, then select the 250 V range. Refer to Troubleshooting With an Insulation Multimeter for important usage instructions.

NOTE: **The following step assumes the X98 Hybrid/EV Battery Charger Receptacle high voltage DC cable is connected to the T24 Battery Charger - DC.**

4. Test for 15M Ω between the terminals listed below at the X98 Hybrid/EV Battery Charger Receptacle and chassis ground:
    - Terminal DC-
    - Terminal DC+
    - **If less than 15M Ω on either circuit**
    1. Disconnect the X2 harness connector at the T24 Battery Charger - DC.
    2. Select the Isolation Test setting, then change the voltage range from 250 V to the 500 V range.

    NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle.**

    3. Test for 550M Ω between the circuit terminals listed below and chassis ground:
        - Terminal DC-
        - Terminal DC+
        - If less than 550M Ω, replace the X98 Hybrid/EV Battery Charger Receptacle.
        - If 550M Ω replace the T24 Battery Charger - DC.
    - **If greater than 15M Ω on either circuit**

    Replace the T24 Battery Charger - DC and the X98 Hybrid/EV Battery Charger Receptacle.

- **If 15M Ω on both circuits**

5. Connect all disconnected components and connectors and enable high voltage.

NOTE: **It may be necessary to connect the vehicle to a DC Charge Station.**

6. Verify that DTC P302F does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If DTC P302F is set**

      Contact the GM Technical Assistance Center to report a DC Charge Station problem.

    - **If DTC P302F is not set**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)** for X98 Hybrid/EV Battery Charger Receptacle and harness replacement.
- **Control Module References** for the T24 battery charger - DC and hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P325C OR P325D: HYBRID/EV BATTERY DC CHARGING COMMUNICATION GATEWAY MODULE PROCESSOR PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P325C

Hybrid/EV Battery DC Charging Communication Gateway Module Processor Performance

DTC P325D

Hybrid/EV Battery DC Charging Communication Gateway Module Main Processor Performance

Circuit/System Description

This diagnostic runs when the vehicle is connected to a DC fast charge station. This is an internal fault detection of the power line communication module and no external circuits are involved.

Conditions for Running the DTC

Vehicle is connected to a DC fast charge station.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Actions Taken When the DTC Sets

DTC P325C or P325D is a type B DTC.

Conditions for Clearing the DTC

DTC P325C or P325D is a type B DTC.

Circuit/System Verification

1. Connect the vehicle to a DC fast charge station.
2. Verify DTC P325C or P325D is not set.
    - **If either of the DTCs are set**

      Replace the K190 Power Line Communication Module.

    - **If none of the DTCs are set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Power Line Communication Module replacement, programming, and setup.

DTC P325F : HYBRID/EV BATTERY DC CHARGING COMMUNICATION GATEWAY MODULE - OFFBOARD DC CHARGER COMMUNICATION INTERRUPTED (NORTH AMERICA, KOREA)

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P325F

Hybrid/EV Battery DC Charging Communication Gateway Module - Offboard DC Charger Communication Interrupted

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the control pilot signal from the DC fast station. When the hybrid/EV powertrain control module 2 detects a 5% duty cycle pulse width modulated (PWM) signal on the control pilot circuit, the hybrid/EV powertrain control module 2 commands the power line communication module to begin communication with the DC fast charge station.

The power line communication module communicates to the DC fast charge station using power line communication (PLC) over the control pilot circuit. The specific PLC technology used is HomePlug Green PHY to allow for digital communication over a single wire.

Conditions for Running the DTC

Vehicle is connected to a DC fast charge station and is charging.

Conditions for Setting the DTC

Communication between the power line communication module and the DC fast charge station is interrupted.

Actions Taken When the DTC Sets

DTC 325F is type C DTC.

Conditions for Clearing the DTC

DTC 325F is type C DTC.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Clear the DTC, connect the vehicle to a known good DC fast charge station.
2. Allow the vehicle to charge for at least 20 minutes.
3. Verify DTC P325F is set.
    - **If DTC P325F is not set**

      Contact the GM Technical Assistance Center to report a DC fast charge station problem.

    - **If DTC P325F is set**
4. Vehicle OFF, disable the high voltage at the T18 Battery Charger. Refer to High Voltage Disabling . Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Disconnect the X2 harness connector at the K190 Power Line Communication Module.

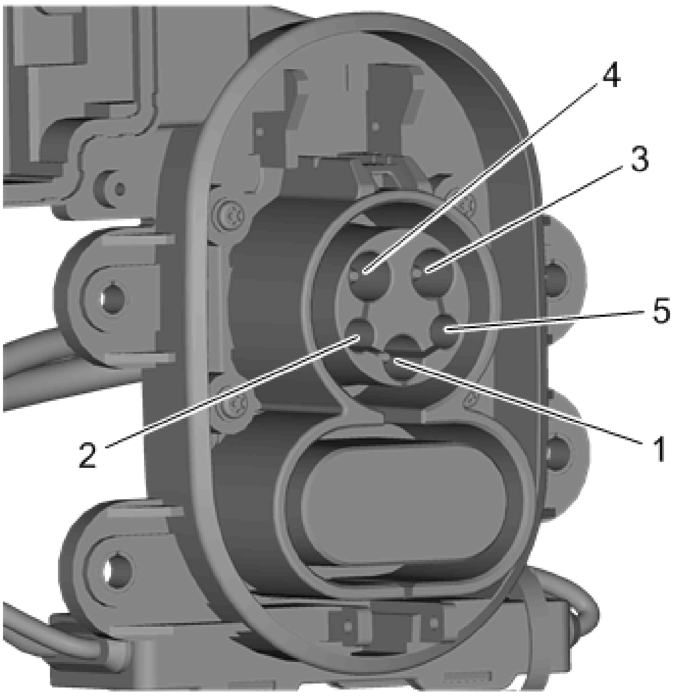

Fig. 14: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

5. Test for infinite resistance between the control pilot signal circuit terminal 2 of the X98 Hybrid/EV Battery Charger Receptacle and the terminals listed below:
    - Terminal 1

- Terminal 3
- Terminal 4
- Terminal 5
- DC+
- DC-
- **If less than infinite resistance**

1. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.

NOTE: **This test is performed on the vehicle side of the harness connector.**

2. Test for infinite resistance between the harness connector control pilot signal circuit terminal 2 and the terminals listed below:

- Terminal 4
- Terminal 1
- Terminal 5
- Terminal 3
- DC+
- DC-
  - If less than infinite resistance, repair the short between the circuits.
  - If infinite resistance, replace the X98 Hybrid/EV Battery Charger Receptacle.
- **If infinite resistance**

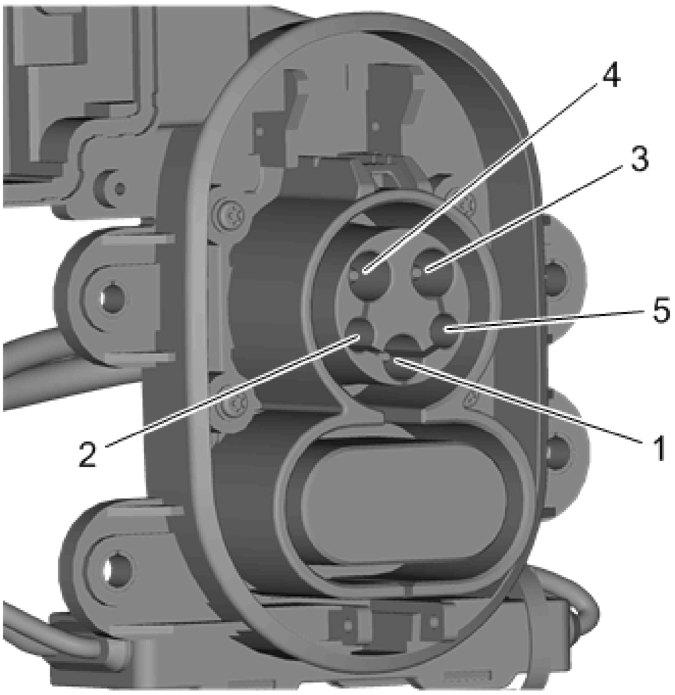

Fig. 15: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

6. Test for less than 2 Ω in the control pilot signal circuit end to end between the terminals listed below:
   - K190 Power Line Communication Module terminal 8 X2 and X98 Hybrid/EV Battery Charger Receptacle 2
   - K114B Hybrid/EV Powertrain Control Module 2 terminal 8 X2 and X98 Hybrid/EV Battery Charger Receptacle 2
   - **If 2 Ω or greater**

   1. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.

   NOTE: **This test is performed at the X98 Hybrid/EV Battery Charger Receptacle.**

   2. Test for less than 2 Ω in the control pilot signal circuit end to end.
      - If 2 Ω or greater, replace the X98 Hybrid/EV Battery Charger Receptacle.

- If less than 2 Ω, repair the open/high resistance in the circuit.
- **If less than 2 Ω**

7. Replace the K190 Power Line Communication Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)**
- **Control Module References** for Power Line Communication Module replacement, programming and setup.

PLUG-IN CHARGING MALFUNCTION (AC CHARGING (NORTH AMERICA, KOREA))

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control Pilot Signal	P0CF4, P0CF5, P0CF6, P0CF9, P0D01, 1	P0CF4, P0CF5, P0CF6, 1	P0CF4, P0CF5, P0CF6, P0CF9, 1	P0CF4, P0CF5, P0CF6, 1

Voltage AC Neutral Line 2	1	P1EE6	1	-
Voltage AC Ground	-	P0D59, 1	1	-
1. Plug In Charging Malfunction				

Circuit/System Description

The drive motor battery charger cable allows the vehicle to be charged using a common household power outlet. The drive motor battery charger cable contains LEDs that indicate the status of the drive motor battery charger cable. The drive motor battery charger cable automatically prohibits voltage transfer to the hybrid/EV battery charger receptacle and the Fault Indicator is illuminated red if it senses internal faults or inadequate household voltage. If the drive motor battery charger cable senses no faults, the AC Present Indicator is illuminated solid green.

When the hybrid/EV powertrain control module 2 senses the drive motor battery charger cable is connected to the vehicle charge receptacle, it will communicate with the off-vehicle charge equipment to ensure compatibility and proper function. The hybrid/EV powertrain control module 2 will then indicate the status of charging events (including user-programmable delays) to the user via instrument panel mounted plug-in charging status indicator LEDs and audio tones.

Diagnostic Aids

- If the drive motor battery charger cable Fault Indicator is illuminated solid red or flashing red before plugging into the vehicle, the charger cable will need to be diagnosed first.
- Ensure delayed charging is not enabled. Delay charging can be programmed either in the vehicle or also in certain off-vehicle Charge Stations.

Circuit/System Verification

1. Vehicle ON, verify no DTCs are set.
    - **If DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
    - **If no DTCs are set**
2. Vehicle OFF. With the charge cord NOT connected to the vehicle battery charger receptacle, verify the vehicle plug-in charging status indicators are OFF.
    - **If the vehicle plug-in charging status indicators are not OFF with the charge cord disconnected from the vehicle**

      Refer to **Plug-In Charging Indicator Malfunction**.
    - **If the vehicle plug-in charging status indicators are OFF**
3. Vehicle OFF and connect the charge cord to the vehicle battery charger receptacle.
4. Verify the vehicle charge status indicator is operating properly.
    - **If the vehicle charge status indicator is solid yellow**

      Refer to Circuit/System Testing.
    - **If the vehicle charge status indicator is not illuminated**
    1. Vehicle ON.

       NOTE: **Vehicle must be ON and not in Service Mode for message operation.**
    2. Verify the Charge Cord Connected message is displayed in the instrument panel/message center.
        - If the Charge Cord Connected message is displayed, refer to **Plug-In Charging Indicator Malfunction**.
        - If the Charge Cord Connected message is NOT displayed
    3. Refer to Circuit/System Testing.
    - **If the vehicle charge indicator is operating properly**

NOTE: **The Charge History parameters record the conditions present during the last 5 charge events.**

5. Review the K114B Hybrid/EV Powertrain Control Module 2, Charge History Scan Tool Parameters. Inspect for any conditions that prohibited AC Charging.
    - **If an off-vehicle charge cord/station condition or delayed charging prohibited AC Charging**

      The vehicle is OK. Advise customer about delayed charging operation or charge cord/station condition.

    - **If an off-vehicle condition or delayed charging was not observed**
6. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
    - **Visually and functionally inspect the gloves before use.**
    - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Connect the customer's drive motor battery charger cable to household power outlet, but not the vehicle battery charger receptacle.
2. After 25 seconds, verify the drive motor battery charger cable AC Present Indicator illuminates solid green.
    - **If the drive motor battery charger cable AC Present Indicator does not illuminate solid green**
    1. Connect a known good drive motor battery charger cable to the same household power outlet.
    2. After 25 seconds, verify the known good drive motor battery charger cable AC Present Indicator illuminates solid green.
        - If the known good drive motor battery charger cable AC Present Indicator illuminates solid green, replace the customer's drive motor battery charger cable.
        - If the known good drive motor battery charger cable AC Present Indicator does not illuminate solid green, have the service provider inspect the household power outlet for insufficient voltage, high frequency noise, or open/high resistance.
    - **If the drive motor battery charger cable AC Present Indicator does illuminate solid green**

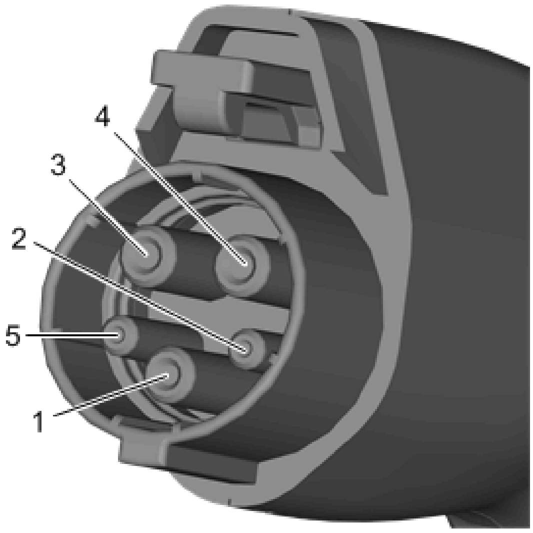

Fig. 16: Drive Motor Battery Charger Cable Terminals
Courtesy of GENERAL MOTORS COMPANY

3. Test for greater than 1 V between the low voltage circuits listed below on drive motor battery charger cable.
   - Control pilot signal circuit terminal 2
   - Proximity status signal circuit terminal 5
   - **If less than 1 V**

     Replace drive motor battery charger cable.
   - **If greater than 1 V**

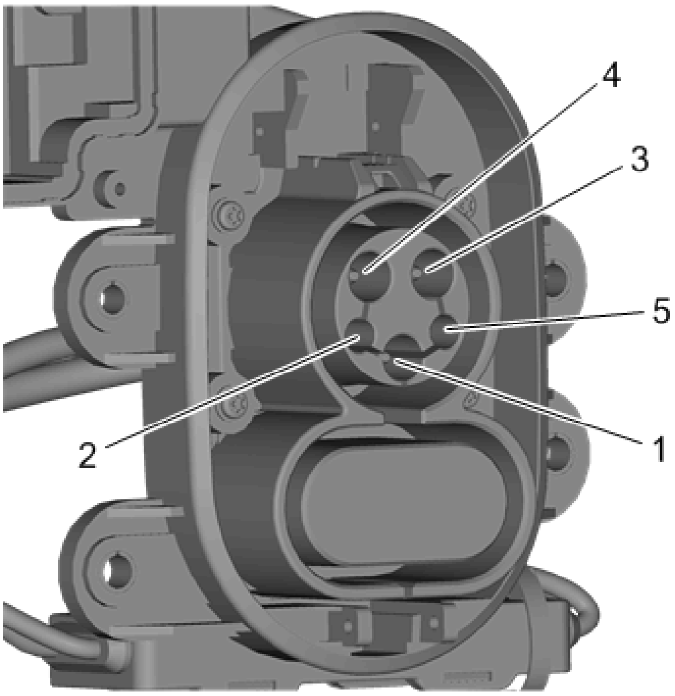

Fig. 17: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

NOTE: **When measuring resistance observe proper meter polarity by connecting the common/ground meter probe to ground/vehicle chassis.**

NOTE: **You must measure with a high-impedance Digital Multimeter (DMM) such as the EL-39200 or equivalent.**

4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for 100k Ω - 4M Ω between the control pilot signal terminal 2 at the X98 Hybrid/EV Battery Charger Receptacle and ground.
   - **If 4M Ω greater**
   1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2
   2. Test for 2 Ω in the control pilot signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 100k Ω**
   1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2
   2. Test for infinite resistance between the control pilot signal circuit and ground.
      - If less than infinite resistance, repair the short to ground in the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If within the specified range**
5. Test for less than 10 Ω between the Voltage AC Ground terminal 1 at the X98 Hybrid/EV Battery Charger Receptacle and ground.
   - **If 10 Ω or greater**

   NOTE: **G108 is located behind the front fender.**

   1. Disconnect the G108 ring terminal. Refer to Ground Nut removal in **Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)**.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, replace the X98 Hybrid/EV Battery Charger Receptacle.
      - If less than 2 Ω, clean and reinstall the G108 ring terminal and ground nut.
   - **If less than 10 Ω**
6. Vehicle in Service Mode.
7. Test for less than 1 V between the control pilot signal terminal 2 at the X98 Hybrid/EV Battery Charger Receptacle and ground.
   - **If 1 V or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
   2. Test for less than 1 V between the control pilot signal circuit and ground.
      - If greater than 1 V, repair the short to voltage in the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 1 V**

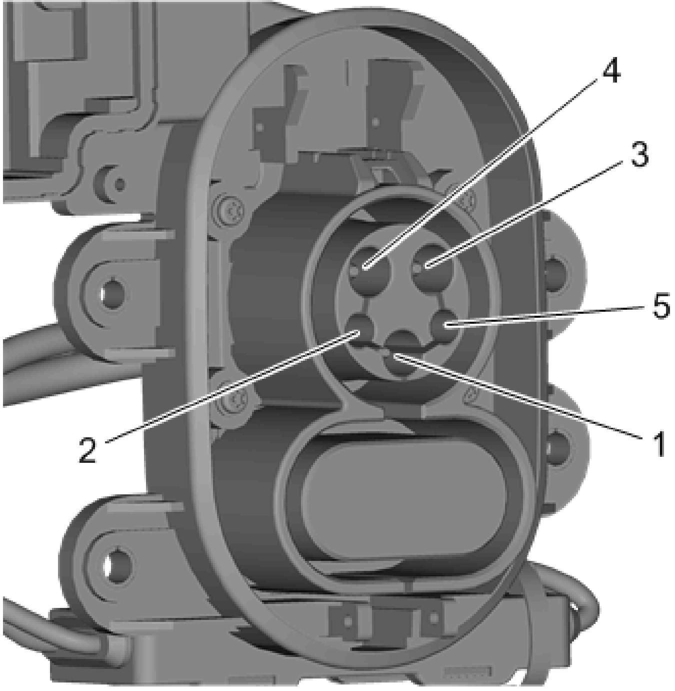

Fig. 18: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

8. Test for 4.2 - 4.8 V between the signal circuit terminal 5 and ground.
   - **If less than 4.2 V**
   1. Vehicle OFF, disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.

      NOTE: **The following tests are performed at the vehicle harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

   2. Test for 4.8 V or greater between the signal circuit terminal 5 and ground.
      - If less than 4.8 V
      1. Vehicle OFF. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
      2. Test for infinite resistance between the signal circuit terminal 5 and ground.
         - If less than infinite resistance, repair the short to ground in the circuit.
         - If infinite resistance
      3. Test for less than 2 Ω in the signal circuit end to end.
         - If 2 Ω or greater, repair the open/high resistance in the circuit.
         - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
      - If 4.8 V or greater, replace the X98 Hybrid/EV Battery Charger Receptacle.
   - **If greater than 4.8 V**
   1. Vehicle OFF, disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.

      NOTE: **The following tests are performed at the vehicle harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

   2. Test for 4.8 - 5.2 V between the signal circuit terminal 5 and ground.
      - If greater than 5.2 V
      1. Vehicle OFF. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
      2. Vehicle in Service Mode. Test for less than 1 V between the signal circuit terminal 5 and ground.
         - If 1 V or greater, repair the short to voltage in the circuit.
         - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
      - If within 4.8 - 5.2 V

    3. Test for 2.565 - 2.835K Ω between the signal circuit terminal 5 and the low reference circuit terminal 1 at the face of the X98 Hybrid/EV Battery Charger Receptacle.
        - If not within the specified range, replace the X98 Hybrid/EV Battery Charger Receptacle.
        - If within the specified range, replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If within 4.2 - 4.8 V**

9. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the X2 harness connector at the T18 Battery Charger, the X2 connector at the K114B Hybrid/EV Powertrain Control Module 2 and the X2 connector at the K190 Power Line Communication Module.

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

10. Test for infinite resistance between the terminals listed below at the X98 Hybrid/EV Battery Charger Receptacle:
    - Voltage AC Line 1 terminal 3 and Voltage AC Neutral Line 2 terminal 4
    - Voltage AC Line 1 terminal 3 and Voltage AC Ground terminal 1
    - Voltage AC Line 1 terminal 3 and Control pilot signal circuit terminal 2
    - Voltage AC Line 1 terminal 3 and Proximity status signal circuit terminal 5
    - Voltage AC Neutral Line 2 terminal 4 and Voltage AC Ground terminal 1
    - Voltage AC Neutral Line 2 terminal 4 and Control pilot signal circuit terminal 2
    - Voltage AC Neutral Line 2 terminal 4 and Proximity status signal circuit terminal 5
    - Voltage AC Ground terminal 1 and Control pilot signal circuit terminal 2
    - Control pilot signal circuit terminal 2 and Proximity status signal circuit terminal 5
    - **If less than infinite resistance**

      Repair the short between the circuits.

    - **If infinite resistance**

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

11. Test for less than 10 Ω between the terminals listed below:
    - Voltage AC Line 1 terminal 3 at the X98 Hybrid/EV Battery Charger Receptacle and T18 Battery Charger terminal 1 X2
    - Voltage AC Neutral Line 2 terminal 4 at the X98 Hybrid/EV Battery Charger Receptacle and T18 Battery Charger terminal 4 X2
    - **If 10 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 10 Ω**
    - **If infinite resistance**
12. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.
13. Test for 2.56 - 2.84k Ω between the Voltage AC Ground terminal 1 and Proximity status signal circuit terminal 5 at the face of the X98 Hybrid/EV Battery Charger Receptacle.
    - **If not within the specified range**

      Replace the X98 Hybrid/EV Battery Charger Receptacle.

    - **If within the specified range**

NOTE: **This test is performed on the vehicle side of the harness connector.**

14. Test for infinite resistance between the Proximity status signal circuit terminal 5 of the harness connector and ground.

- **If less than infinite resistance**

  Repair short to ground on the circuit.

- **If infinite resistance**

15. Replace and program the K114B Hybrid/EV Powertrain Control Module 2.
16. Repeat Circuit/System Verification and confirm vehicle is All OK.
    - **If Circuit/System Verification was not All OK**

      Replace the T18 Battery Charger.

    - **If Circuit/System Verification was All OK**
17. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)Drive Motor Battery Charger Receptacle Replacement (Dubai only with quick charge)Drive Motor Battery Charger Receptacle Replacement (Dubai only without quick charge)**
- **Control Module References** for T18 battery charger or K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

PLUG-IN CHARGING MALFUNCTION (DC CHARGING (NORTH AMERICA, KOREA))

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Plug In Charging Malfunction * DTCs set with Pass/Fail Status ** DTC set if 120/240 volt cordset is used				

Circuit/System Description

A direct current (DC) fast charge drive motor battery charger cable allows vehicles equipped with RPO CBT to be charged using a 480 V offboard DC charger. The hybrid/EV powertrain control module 2 and power line communication module automatically prohibit voltage transfer to the hybrid/EV battery charger receptacle if an internal fault or inadequate voltage is detected. If no faults are detected, voltage transfer to the hybrid/EV battery charger receptacle occurs.

Diagnostic Aids

- Most DC fast charge concerns, especially those without an accompanying DTC set, are the result of off-vehicle charge station or electrical infrastructure issues. Always verify a DC Fast charge concern by connecting to a known good charge station.
- Some off-vehicle DC Charge Stations allow for multiple vehicle connection and authorization yet they will only charge one vehicle at a time.
- DC charging requires positive locking of the charge cord to the vehicle charge receptacle. Ensure the customer is inserting the charge cord into the charge receptacle completely. Ease of insertion and locking may vary among DC Charge Stations.

Circuit/System Verification

1. Vehicle in Service Mode, verify no additional DTCs are set in other control modules.
    - **If additional DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no additional DTCs are set**

NOTE: **Certain DTCs inhibit DC Charging, clearing the DTC alone will not clear the inhibit condition.**

2. Verify DTCs that disable DC Charging were not recently cleared.
    - **If DTCs were cleared**

      Perform the **DC Charging Disabled Reset**.

    - **If DTCs were not cleared or the DC Charging Disable Reset had been performed**

NOTE: **Loss of 12V or programming of the module will inhibit DC Charging.**

3. Verify that a low/no 12V condition was not present at the K114B Hybrid/EV Powertrain Control Module or that the module was not recently programmed.
    - **If the specified conditions occurred**

      The vehicle must be driven at a speed greater than 30 km/h (19 mph) to re-enable DC Charging.

    - **If the specified conditions had not occurred or the vehicle had been driven**
4. Connect a 120/220V AC charge cord and verify the vehicle will AC charge.
    - **If the vehicle will not AC Charge**

      Refer to the AC Charging document Plug-In Charging Malfunction (AC Charging (North America, Korea))Plug-In Charging Malfunction (DC Charging (North America, Korea)).

    - **If the vehicle will AC Charge**

NOTE: **The DC Charge History parameters record the conditions present during the last 5 charge events.**

5. Review the K114B Hybrid/EV Powertrain Control Module 2, DC Charge History Scan Tool Parameters (w/CBT). Inspect for any conditions that prohibited DC Charging.
    - **If an off-vehicle charge station condition prohibited DC Charging**

      The vehicle is OK. Contact the GM Technical Assistance Center to report a DC Charge Station problem.

    - **If an off-vehicle condition was not observed**

NOTE: **Review diagnostic aids.**

6. Verify with the customer whether the off-vehicle DC Charge Station had multiple charge cords, or they had difficulty in connecting the charge cord to the receptacle.
    - **If any of the conditions were observed**

      The vehicle is OK. Contact the GM Technical Assistance Center to report a DC Charge Station problem.

    - **If the conditions were not observed**

NOTE: **The following setup steps MUST BE PERFORMED EXACTLY in order to exercise the contactors.**

7. Vehicle OFF. Turn ON the park lamps.

NOTE:

- **DO NOT press the power button and enter Vehicle in Service Mode or Vehicle ON.**
- **Ignore P0ABC after pulling the S15 Manual Service Disconnect.**

NOTE: **There are two contactor control functions available on the scan tool from the Hybrid/EV Powertrain Control Module 2. Make sure you select the DC charging contactor control and not the battery contactor control.**

8. Command the Hybrid/EV DC Charging Contactors ALL OPEN with a scan tool.
9. Disconnect the S15 Manual Service Disconnect.

NOTE:

- **DO NOT use the Release Control button to turn OFF any of the contactors. Once the Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning including reinstalling the S15 Manual Service Disconnect and clearing DTCs.**
- **The following steps can be performed in any sequence or a single contactor can be exercised to verify a complaint.**

10. Command the Hybrid/EV Battery DC Charging Negative Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

NOTE: **It is normal for the charging contactors to only make noise while opening.**

11. Verify the Hybrid/EV Battery DC Charging Negative Contactor is heard closing and opening.
    - **If the Hybrid/EV Battery DC Charging Negative Contactor does not open and close**

      Refer to Circuit/System Testing.

    - **If the Hybrid/EV Battery DC Charging Negative Contactor does open and close**
12. Command the Hybrid/EV Battery DC Charging Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.
13. Verify the Hybrid/EV Battery DC Charging Positive Contactor is heard closing and opening.
    - **If the Hybrid/EV Battery DC Charging Positive Contactor does not open and close**

      Refer to Circuit/System Testing.

    - **If the Hybrid/EV Battery DC Charging Positive Contactor does open and close**

NOTE: **It is normal for the Hybrid/EV Battery DC Negative Contactor to be slightly quieter than the positive contactor.**

14. Repeat opening and closing of both DC Charging contactors several times while comparing the sound made by each contactor.
    - **If either contactor intermittently stops working**

      Replace the T24 Battery Charger - DC.

    - **If both contactors consistently generate sound**
15. Connect to a known good DC Charge Station. Verify vehicle will fast charge and no DTCs are set.
    - **If the vehicle will not fast charge and DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If the vehicle will not fast charge and no DTCs are set**

      Refer to Circuit/System Testing.

    - **If the vehicle will fast charge**
16. All OK.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**

- **Visually and functionally inspect the gloves before use.**
- **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

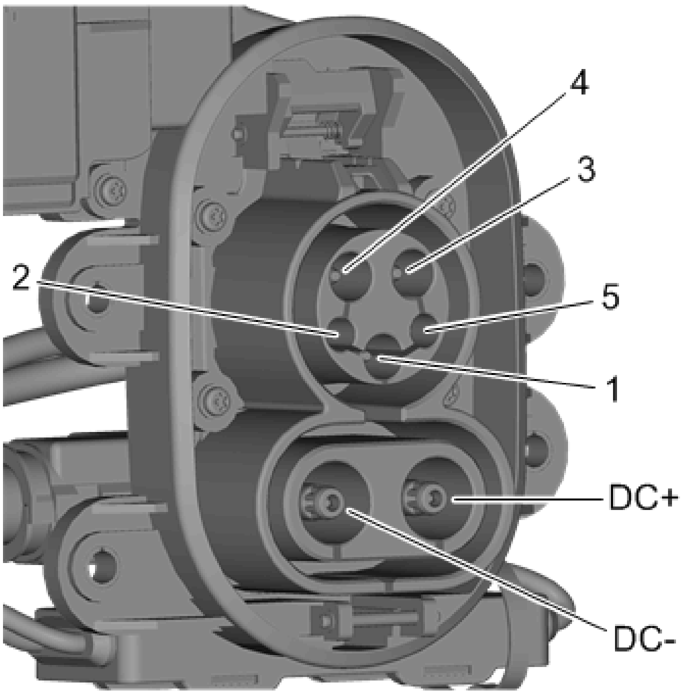

Fig. 19: X98 Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle face and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

NOTE: **When measuring resistance observe proper meter polarity by connecting the common/ground meter probe to ground/vehicle chassis.**

NOTE: **You must measure with a high-impedance Digital Multimeter (DMM) such as the EL-39200 or equivalent.**

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for 100k - 4M Ω between the control pilot signal terminal 2 at the X98 Hybrid/EV Battery Charger Receptacle and ground.
    - **If 4M Ω or greater**
    1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2
    2. Test for 2 Ω in the control pilot signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than 100k Ω**
    1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control pilot signal circuit and ground.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
        - If less than infinite resistance
    3. Vehicle OFF, disconnect the X9 harness connector at the T24 Battery Charger - DC.
    4. Test for infinite resistance between the control pilot signal circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance, replace the T24 Battery Charger - DC.
    - **If within the specified range**

2. Test for less than 10 Ω between the Voltage AC Ground terminal 1 at the X98 Hybrid/EV Battery Charger Receptacle and ground.
    - **If 10 Ω or greater**

      NOTE: G108 is located behind the front fender.

    1. Disconnect the G108 ring terminal. Refer to Ground Nut removal in Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge).
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, replace the X98 Hybrid/EV Battery Charger Receptacle.
        - If less than 2 Ω, clean and reinstall the G108 ring terminal and ground nut.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for less than 1 V between the control pilot signal terminal 2 at the X98 Hybrid/EV Battery Charger Receptacle and ground.
    - **If 1 V or greater**
    1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
    2. Test for less than 1 V between the control pilot signal circuit and ground.
        - If greater than 1 V, repair the short to voltage in the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
        - If greater than 1 V
    3. Vehicle OFF, disconnect the X9 harness connector at the T24 Battery Charger - DC. Vehicle in Service Mode.
    4. Test for less than 1 V between the control pilot signal circuit and ground.
        - If greater than 1 V, repair the short to voltage in the circuit.
        - If less than 1 V, replace the T24 Battery Charger - DC.
    - **If less than 1 V**

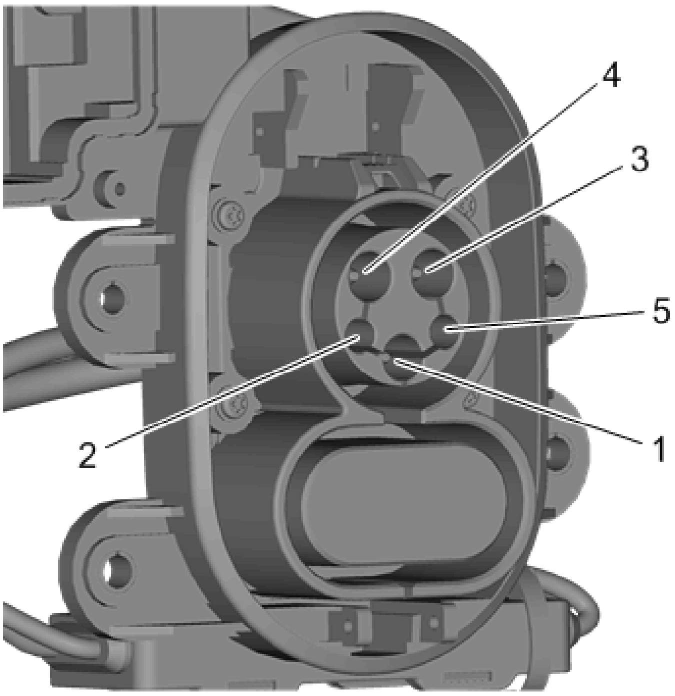

Fig. 20: Hybrid/EV Battery Charger Receptacle
Courtesy of GENERAL MOTORS COMPANY

5. Test for 4.2 - 4.8 V between the signal circuit terminal 5 and ground.
    - **If less than 4.2 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.

NOTE: **The following tests are performed at the vehicle harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

    2. Test for 4.8 V or greater between the signal circuit terminal 5 and ground.
        - If less than 4.8 V
        1. Vehicle OFF. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
        2. Test for infinite resistance between the signal circuit terminal 5 and ground.
            - If less than infinite resistance, repair the short to ground in the circuit.
            - If infinite resistance
        3. Test for less than 2 Ω in the signal circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
        - If 4.8 V or greater, replace the X98 Hybrid/EV Battery Charger Receptacle.
    - **If greater than 4.8 V**
    1. Vehicle OFF, disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.

NOTE: **The following tests are performed at the vehicle harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

    2. Test for 4.8 - 5.2 V between the signal circuit terminal 5 and ground.
        - If greater than 5.2 V
        1. Vehicle OFF. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
        2. Vehicle in Service Mode. Test for less than 1 V between the signal circuit terminal 5 and ground.
            - If 1 V or greater, repair the short to voltage in the circuit.
            - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
        - If within 4.8 - 5.2 V
    3. Test for 2.565 - 2.835K Ω between the signal circuit terminal 5 and the low reference circuit terminal 1.
        - If not within the specified range, replace the X98 Hybrid/EV Battery Charger Receptacle.
        - If within the specified range, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If within 4.2 - 4.8 V**

6. Disable the high voltage for servicing at the T24 Battery Charger. Refer to High Voltage Disabling . Disconnect the X2 harness connector at the T24 Battery Charger DC.

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle face and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

7. Test for infinite resistance between the terminals listed below at the X98 Hybrid/EV Battery Charger Receptacle:
    - High Voltage DC Positive terminal DC+ and High Voltage DC Negative terminal DC-
    - Control pilot signal circuit terminal 2 and Proximity status signal circuit terminal 5
    - **If less than infinite resistance**

      Replace the X98 Hybrid/EV Battery Charger Receptacle.

    - **If infinite resistance**
8. Test for less than 10 Ω between the terminals listed below:
    - High Voltage DC Positive terminal DC+ at the X98 Hybrid/EV Battery Charger Receptacle and terminal A X2
    - High Voltage DC Negative terminal DC- at the X98 Hybrid/EV Battery Charger Receptacle and terminal B X2
    - **If 10 Ω or greater**

Replace the X98 Hybrid/EV Battery Charger Receptacle.

- **If less than 10 Ω**

9. Disconnect the X1 harness connector at the X98 Hybrid/EV Battery Charger Receptacle.

NOTE: **The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle face and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.**

10. Test for 2.56 - 2.84k Ω between the Voltage AC Ground terminal 1 and Proximity status signal circuit terminal 5 at the X98 Hybrid/EV Battery Charger Receptacle.
    - **If not within the specified range**

      Replace the X98 Hybrid/EV Battery Charger Receptacle.

    - **If within the specified range**
11. Replace the T24 Battery Charger - DC.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Drive Motor Battery Charger Receptacle Replacement (Except Dubai with quick charge)Drive Motor Battery Charger Receptacle Replacement (Except Dubai without quick charge)
- Control Module References for T24 battery charger - DC or K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

PLUG-IN CHARGING INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Charge Pilot Indicator Control	P0D2B	P0D2B	P0D2B	-
Charge Status Indicator Control	P0D2C	P0D2C, 1	P0D2C	-
Charge Complete Indicator Control	1	1	1	-
Low Reference	-	P0D2C, P0D2B	-	-
1. Plug In Charging Indicator Malfunction				

Circuit/System Description

The status of charging events (including delays) is communicated to the user through a vehicle plug-in charge status indicator and audio tones. The vehicle plug-in charge status indicator, located on the top middle of the instrument panel, contains a green LED (charge status indicator) and yellow LED (charge pilot indicator) controlled by the Hybrid Powertrain Control Module 2 and a second green LED (charge complete indicator) controlled by the BCM. The indicator will have a short flash green when the vehicle is charging under automatic control. The flash rate increases from one to four as the battery charges. It will have a long flash green if the charging is delayed and will begin later. It will be illumined solid green when charging is complete. A solid lit yellow indicator means the vehicle is not able to accept a charge.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U135B is not set.
    - **If DTC U135B is set**

      Refer to **DTC U1340-U135F** .

    - **If DTC U135B is not set**
3. Verify no other hybrid/EV battery-related DTCs are set.
    - **If any hybrid/EV battery-related DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If no hybrid/EV battery-related DTCs are set**
4. Vehicle OFF. Ensure the charge cord is not connected to the vehicle.
5. Verify the vehicle charge indicator is OFF.
    - **If the vehicle charge indicator is not OFF**

      Refer to Circuit/System Testing.

    - **If the vehicle charge indicator is OFF**
6. Connect the charge cord.
7. Verify the vehicle charge indicator is operating properly.
    - **If the vehicle charge indicator is solid yellow**

      Refer to **Plug-In Charging Malfunction (AC Charging (North America, Korea))Plug-In Charging Malfunction (DC Charging (North America, Korea))**

    - **If the vehicle charge indicator is OFF**

    1. Vehicle ON.

       NOTE: **Vehicle must be ON and not in Service Mode for message operation.**

    2. Verify the Charge Cord Connected message is displayed in the instrument panel/message center.
        - If the Charge Cord Connected message is displayed, refer to Circuit/System Testing.
        - If the Charge Cord Connected message is NOT displayed

    3. Refer to **Plug-In Charging Malfunction (AC Charging (North America, Korea))Plug-In Charging Malfunction (DC Charging (North America, Korea))**.
  - **If the vehicle charge indicator is operating properly**

8. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator.
2. Test for less than 10 Ω between the low reference terminal 1 and ground.
    - **If 10 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 10 Ω**

NOTE: **If the drive motor battery charger cable is connected. The drive motor battery charger cable must be disconnected for more than 10 s before performing the next step.**

3. Connect a test lamp between the yellow LED control circuit terminal 4 and ground.
4. Verify the test lamp does not illuminate.
    - **If the test lamp illuminates**
    1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp does not illuminate**
5. Connect the drive motor battery charger cable.
6. Verify that the test lamp illuminates or flashes in the first 5 s of connecting the drive motor battery charger cable.
    - **If the test lamp does not illuminate**
    1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control circuit and ground
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
7. Disconnect the drive motor battery charger cable for at least 10 s. Connect a test lamp between the green LED control circuit terminal 3 and ground.
8. Verify test lamp does not illuminate.
    - **If the test lamp illuminates**
    1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp does not illuminate**
9. Connect the drive motor battery charger cable.
10. Verify that the test lamp illuminates or flashes within 25 s of connecting the drive motor battery charger cable.
    - **If the test lamp does not illuminate**
    1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the control circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
11. Replace the B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Sun Load, Ambient Light, and Charge Indicator Sensor Replacement** for B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator replacement.
- **Control Module References** for K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

REPAIR INSTRUCTIONS

CHARGE PORT DOOR REPLACEMENT (EXCEPT DUBAI)

20. Program the drive motor battery charger. **Control Module References**

DRIVE MOTOR BATTERY CHARGER REPLACEMENT (DUBAI)

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. **High Voltage Disabling**
2. Drain the drive motor generator power inverter module cooling system. **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
3. Remove Battery Tray **Battery Tray Replacement**
4. Remove Radiator Surge Tank **Radiator Surge Tank Replacement**
5. Remove Accessory DC Power Control Module **Accessory DC Power Control Module Replacement**

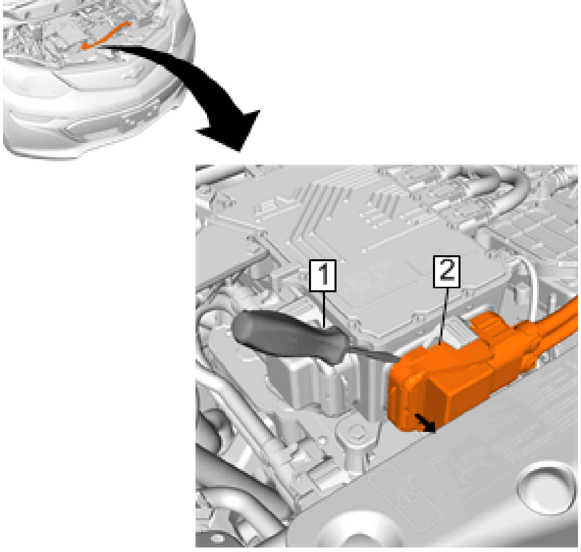

Fig. 42: Flat Bladed Screwdriver And Connector Handle Lock

DRIVE MOTOR BATTERY CHARGER RECEPTACLE REPLACEMENT (EXCEPT DUBAI WITH QUICK CHARGE)

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. High Voltage Disabling
2. Remove Charge Port Housing Charge Port Housing Replacement (Except Dubai)
3. Remove Headlamp Headlamp Replacement

DC CHARGING DISABLED RESET

The DC Charging Disabled Reset procedure must be completed after Isolation Faults have been repaired.

The DC Charging Disabled Reset procedure requires a scan tool sequence and can be completed using the following steps:

1. Vehicle in Service Mode.
2. With a scan tool, select DC Charging Disabled Reset in the Hybrid/EV Powertrain Control Module 2 Configuration/Reset Functions, Reset Functions list.
3. Follow the scan tool directions to complete the procedure.
4. With a scan tool, clear any DTCs that may be set.
5. Vehicle OFF.

POWER LINE COMMUNICATION MODULE REPLACEMENT

2	Power Line Communication Module **Procedure** 1. To access the module, open up the floor carpet along the cut line. 2. Disconnect the electrical connectors. 3. Connect the battery negative cable. Battery Negative Cable Disconnection and Connection 4. For programming and set up, refer to Control Module References .

DESCRIPTION AND OPERATION

PLUG-IN CHARGING SYSTEM DESCRIPTION AND OPERATION

Plug-In Charging System Components

The high voltage battery charging system consists of four main components:

1. The off-vehicle charging equipment:
    - Drive motor battery charger cable, often referred to as the travel cord set
    - Optional, permanent 220 - 240 V charge station
2. The hybrid/EV battery charger receptacle, often referred to as the drive motor battery charger receptacle.
3. The battery charger, often referred to as the drive motor battery charger.
4. The hybrid/EV battery pack.

A variety of mechanical, visual, and audio indicators/devices are used to communicate with the user of the charging equipment.

Drive Motor Battery Charger Cable/Charge Station

The drive motor battery charger cable provided with the vehicle features a standard household electrical plug on one end and a plug designed to interface with the vehicles hybrid/EV battery charger receptacle on the other end. The drive motor battery charger cable features a charge current interrupt device with AC power and fault indicators, and it is stored in the vehicle's cargo area. An optional charge station is available for customers who want to reduce the amount of time needed to recharge. The optional charge station, if available, is hard-wired to a 220 - 240 V power supply and must be permanently mounted at the customer's location. The optional charge station features the same plug on the vehicle end as the drive motor battery charger cable.

The Drive Motor Battery Charger Cable Indicators and the Vehicle Indicators

The drive motor battery charger cable has two indicators, the AC Present Indicator and the Fault Indicator, which display its status.

- Solid green AC Present Indicator means AC voltage is present at the wall plug and there are no faults.
- Flashing green AC Present Indicator and solid red Fault Indicator means the electrical outlet or plug is faulty or overheated.
- Solid red Fault Indicator means the AC outlet does not have a proper ground and charging is not permitted for safety reasons.
- Flashing red Fault Indicator means there is a vehicle fault and the charger cable ground-fault circuit interrupter (GFCI) has tripped.
- Solid green AC Present Indicator and flashing red Fault Indicator means the charger cable has failed self-check.

The off-vehicle battery charging equipment is supervised and controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 is the primary controller, and all diagnostic trouble codes will set in that module even though some of the diagnostics are actually run within the battery charger. Charging events can be delayed based on electric rates and departure time. The status of charging events, including delays, is communicated to the user through visual indications, instrument panel mounted charge status indicator, and audio tones. The vehicle charge status indicator, located on the top middle of the instrument panel, will be short flashing green when the vehicle is charging under automatic control. The flash rate increases from one to four as the battery charges. It will be long flashing green if the charging is delayed and will begin later. It will be solid green when charging is complete. A solid yellow indicator means the vehicle is not able to accept a charge. If there is no indicator, the drive motor battery charger cable is not working properly or not connected.

Vehicle Receptacle

The vehicle receptacle, or hybrid/EV battery charger receptacle, is located behind the charging port door on the driver's side rear quarter panel. The receptacle is accessed by depressing and opening the receptacle door.

Battery Charger

The battery charger is a serviceable assembly containing several micro-processors and two separate high voltage chargers. The battery charger is mounted beneath the vehicle under the hybrid/EV battery pack. DEX-COOLÃ‚Â® coolant is used to ensure that the charger does not exceed its maximum designed operating temperature. The battery charger, along with the 14 V power module and the drive motor generator power inverter module, are cooled by a power electronics cooling loop, which is separate from other cooling systems.

12 V Battery Maintenance Mode

Battery Maintenance Mode is an automatic function that prevents deep discharge of the 12 V battery in specific circumstances. It is not dependent on the drive motor battery charger cable being plugged into the hybrid/EV battery charger receptacle. It functions either when the drive motor battery charger cable is plugged in or unplugged. Operation differs depending on whether the power mode is Vehicle Off or Vehicle in Service Mode.

With Vehicle Off, the 12 V battery is monitored at periodic intervals up to a maximum of 30 days. With Vehicle in Service Mode, the 12 V battery is monitored at periodic intervals up to a maximum of 60 hours. If voltage is low, the 12 V battery is charged by the 14 V power module using external power for up to four hours. This function is only intended to prevent a dead 12 V battery and does not provide a full charge. This is more efficient than continuously trickle charging, thus minimizing the usage of external power.

Under normal circumstances, with a 12 V battery that is charged when the vehicle is parked, Battery Maintenance Mode will simply monitor the voltage level, and no charging will be necessary. With Vehicle Off, Battery Maintenance Mode will maintain the 12 V battery for up to 30 days. For longer periods, refer to Owner Manual for instructions.

DC Fast Charging System (if equipped)

The DC high power fast charge system consists of the stationary DC fast charge station, the DC combo plug, the hybrid/EV battery charger receptacle, the battery charger - DC, and the hybrid/EV battery pack. The high voltage DC current is directly supplied to the hybrid/EV battery pack through the battery charger -DC, bypassing the battery charger, often referred to as the drive motor battery charger. The receptacle has a locking mechanism that locks the DC combo plug while power is being transferred to the hybrid/EV battery pack. The mechanical lock is a safety system that is controlled by the hybrid/EV powertrain control module 2. This locking mechanism will disengage once the charging process is completed or terminated and high voltage DC is reduced to a safe voltage level at the DC combo plug.

The hybrid/EV powertrain control module 2 monitors and verifies the following conditions before the charging process can begin:

- The stationary charge station is capable of providing high voltage DC power to the hybrid/EV battery pack.
- The hybrid/EV battery pack temperature can be maintained within the normal operating range.
- No high voltage electrical safety faults are present.
- The receptacle locking mechanism is operating properly.
- Vehicle immobilization is successful, if equipped.

If any of these conditions fail during the charging process, then the charging process will be terminated.

C5B HYBRID/EV BATTERY MODULE 2 X2

-
Connector Part Information - Harness Type: Hybrid/EV Battery - OEM Connector: Not Available - Service Connector: Service by Harness - See Part Catalog - Description: 6-Way

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	-	GY	5578	Battery Voltage Signal 19	I	-
2	-	OG	5576	Battery Voltage Signal 17	I	-
3	-	YE	5574	Battery Voltage Signal 15	I	-
4	-	GN	5572	Battery Voltage Signal 13	I	-
5	-	L-GN	5593	Module Temperature Low Reference 2	I	-

C5C HYBRID/EV BATTERY MODULE 3 X1

-
Connector Part Information - Harness Type: Hybrid/EV Battery - OEM Connector: Not Available - Service Connector: Service by Harness - See Part Catalog - Description: 6-Way

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp

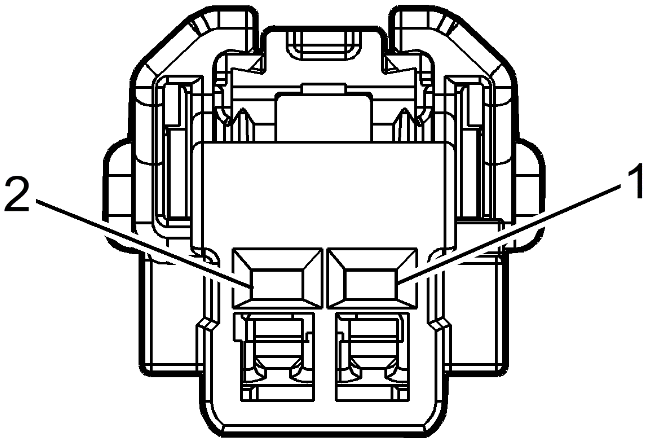
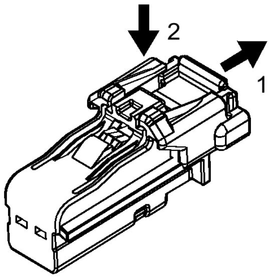
E1G ACCENT LAMP - LEFT INSTRUMENT PANEL





Connector Part Information

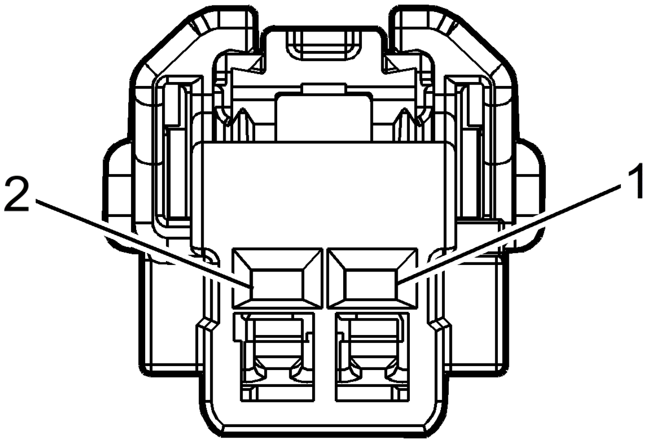
- Harness Type: Instrument Panel
- OEM Connector: 9956-1789
- Service Connector: 19352066
- Description: 2-Way F 1.2 Series (BK)

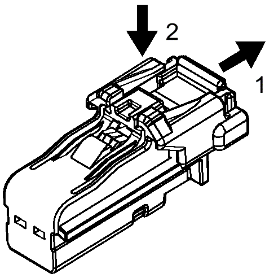
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	BK	1250	Ground	I	C9J
2	0.35	WH/YE	7557	LED Ambient Lighting Control 1	I	C9J

E1H ACCENT LAMP - RIGHT INSTRUMENT PANEL





Connector Part Information

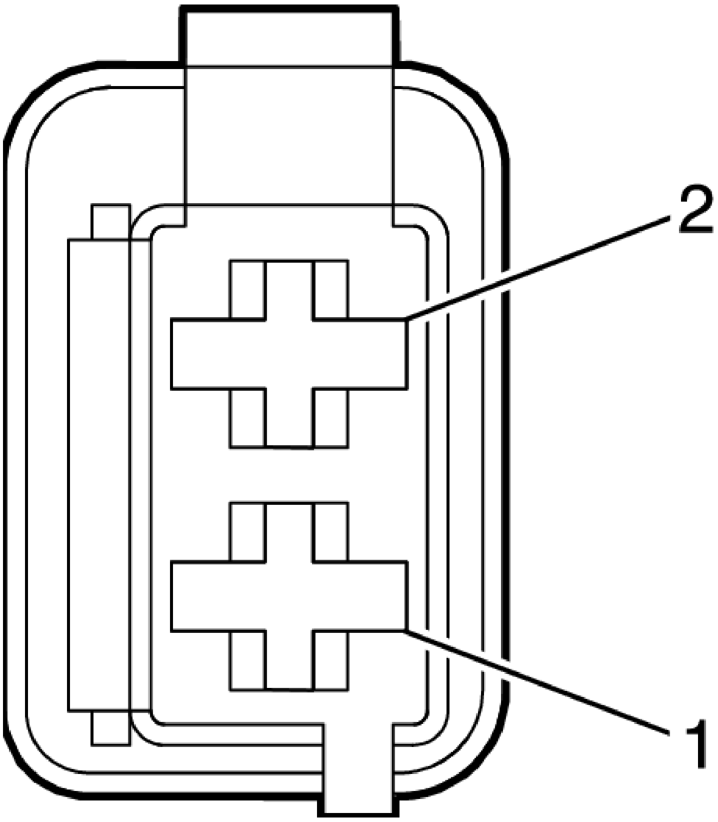
- Harness Type: Instrument Panel
- OEM Connector: 9956-1789
- Service Connector: 19352066
- Description: 2-Way F 1.2 Series (BK)

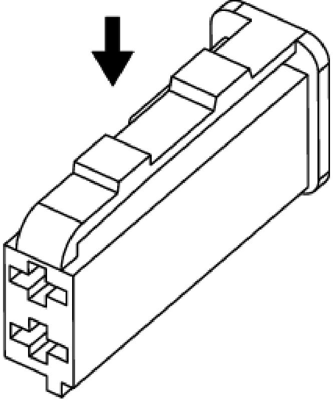
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	BK	1250	Ground	I	C9J
2	0.35	WH/YE	7557	LED Ambient Lighting Control 1	I	C9J

E2LR SIDE MARKER LAMP - LEFT REAR (TW5)





Connector Part Information

- Harness Type: Body
- OEM Connector: 1563189-1
- Service Connector: 13580951
- Description: 2-Way F 1.6 Timer Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option

Connector Part Information

- Harness Type: Engine
- OEM Connector: 33472-0806
- Service Connector: 13577527
- Description: 8-Way F 150 MX Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BK	150	Ground	I	-
2	0.5	BU/WH	3977	Accessory Wakeup Serial Data 2	I	-
3	0.5	VT/WH	1139	Run/Crank Ignition 1 Voltage	I	-
4	0.5	RD/GY	2140	Battery Positive Voltage	I	-
5	0.5	WH	2501	High Speed GMLAN Serial Data (-) 1	I	-

7	0.5	BU	2500	High Speed GMLAN Serial Data (+) 1	I	-
8	0.5	BU	2500	High Speed GMLAN Serial Data (+) 1	I	-

G1 A/C COMPRESSOR X2

-

Connector Part Information

- Harness Type: High Voltage
- OEM Connector: 135050435

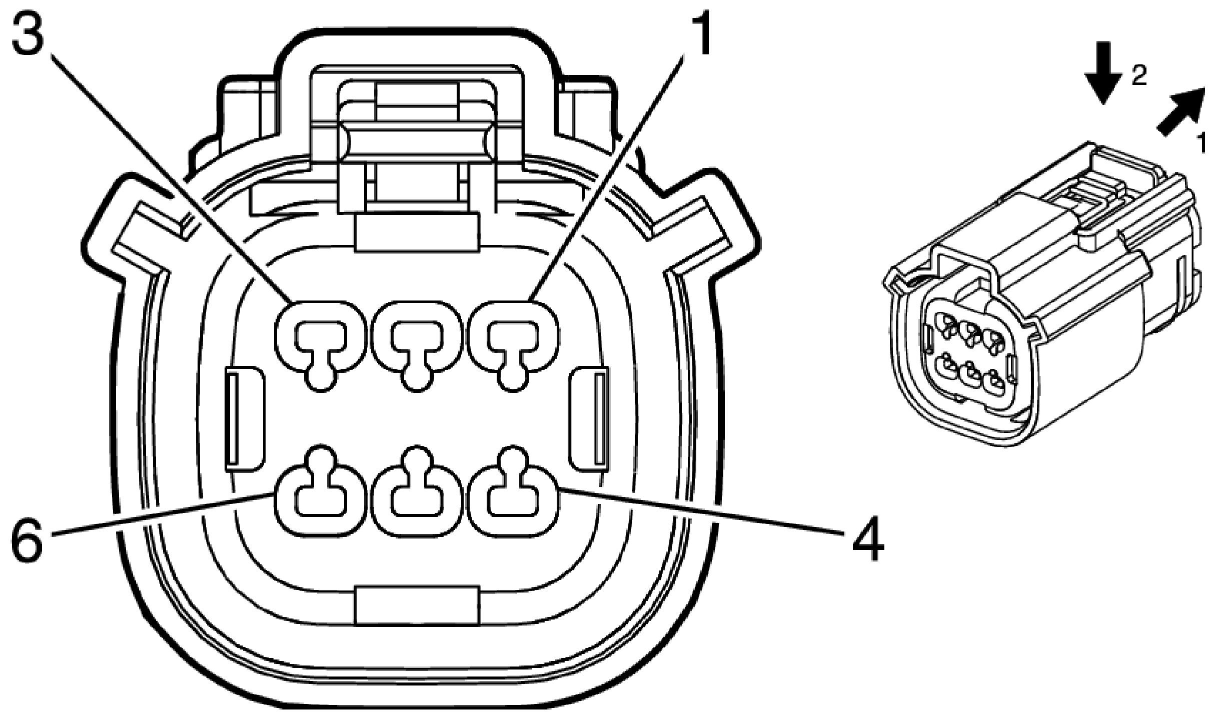
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
A	-	OG	3974	High Voltage Battery 5 (+)	I	-
B	-	OG/BK	3973	High Voltage Battery 5 (-)	I	-

G5 TRANSMISSION FLUID PUMP - ELECTRIC/AUXILIARY



Connector Part Information

- Harness Type: Engine
- OEM Connector: 33472-0681
- Service Connector: 13585853
- Description: 6-Way F 150 MX Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option

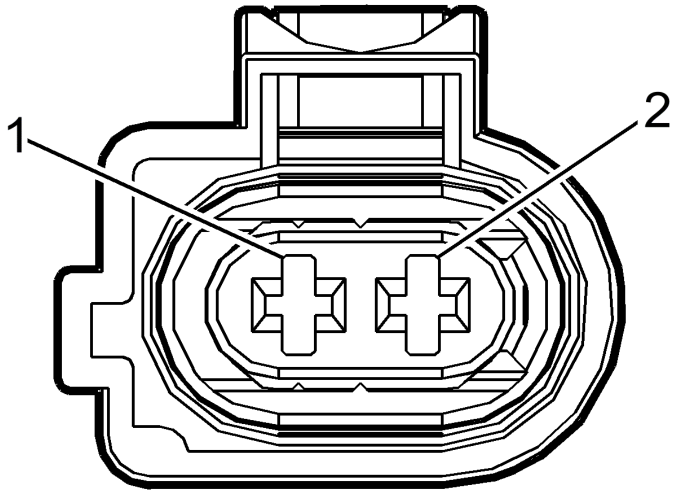
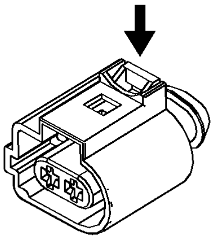
4	0.75	WH	2368	Cooling Fan Control Signal	II	-

G19 REAR WINDOW WASHER PUMP





Connector Part Information

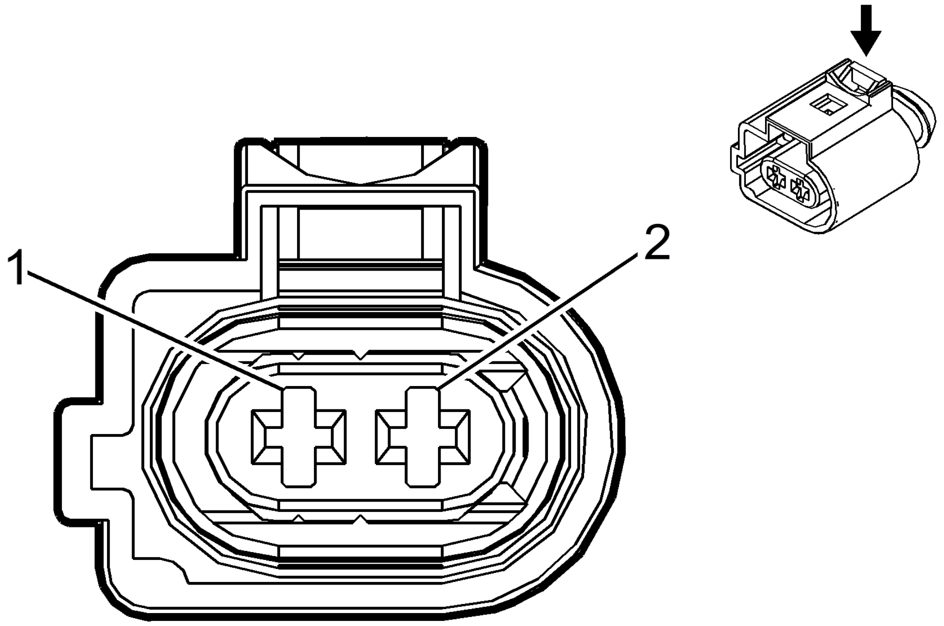
- Harness Type: Forward Lamp
- OEM Connector: 3-1355200-1
- Service Connector: 19301746
- Description: 2-Way F 2.8 MCP Series, Sealed (NA)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-35 (VT)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BU/VT	392	Rear Window Washer Pump Control	I	-
2	0.5	BK	250	Ground	I	-

G24 WINDSHIELD WASHER PUMP



Connector Part Information

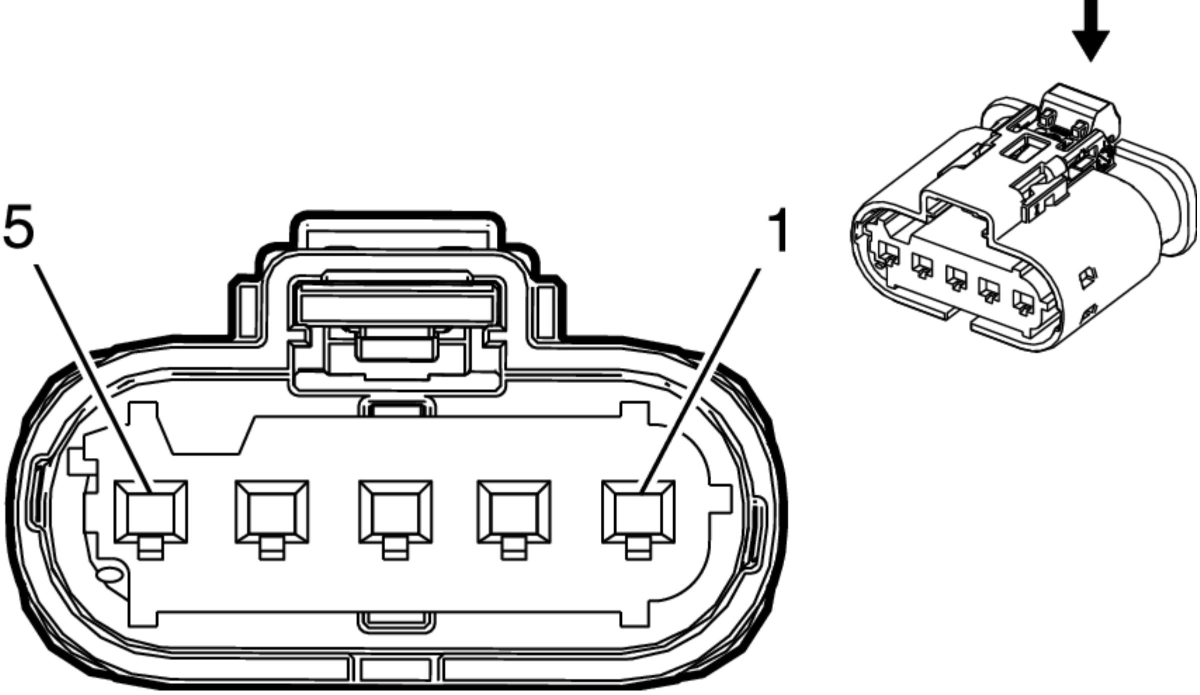
- Harness Type: Forward Lamp
- OEM Connector: 3-1355200-1
- Service Connector: 19301746
- Description: 2-Way F 2.8 MCP Series, Sealed (NA)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-35 (VT)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/VT	228	Windshield Washer Pump Control	I	-
2	0.5	BK	250	Ground	I	-

G35 HYBRID/EV ELECTRONICS COOLANT PUMP



Connector Part Information

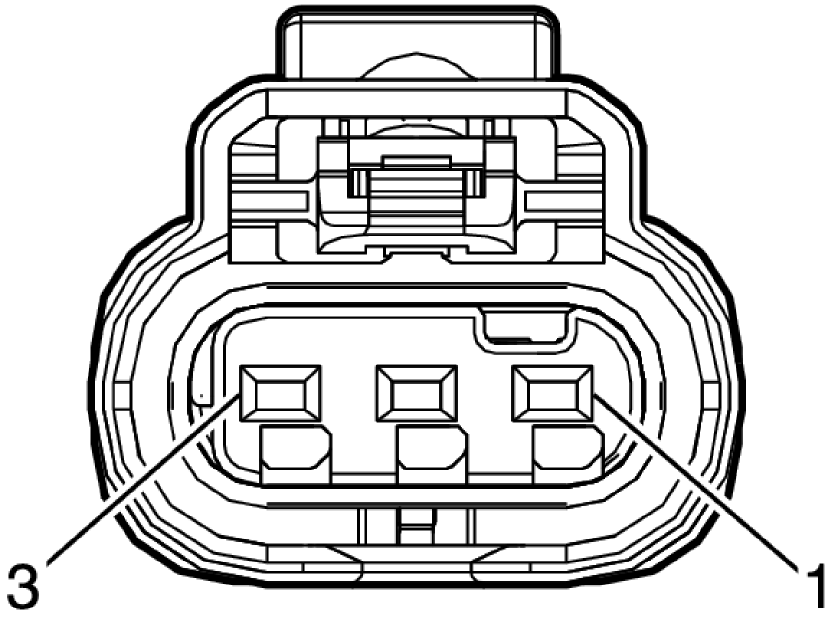
- Harness Type: Engine
- OEM Connector: 9408621
- Service Connector: 19300589
- Description: 5-Way F 1.2 Multilock Series, Sealed (BK)

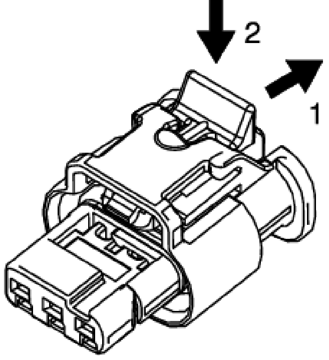
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BN/BU	3788	Electric Coolant Motor Control	I	-
2	0.5	VT/BU	3790	Electric Coolant Motor Feedback Signal	I	-
3	0.5	YE/GN	3789	Electric Coolant Motor Control	I	-
4	0.5	BK	350	Ground	I	-
5	0.5	RD/VT	3340	Battery Positive Voltage	I	-

G36 AUXILIARY HEATER COOLANT PUMP





Connector Part Information

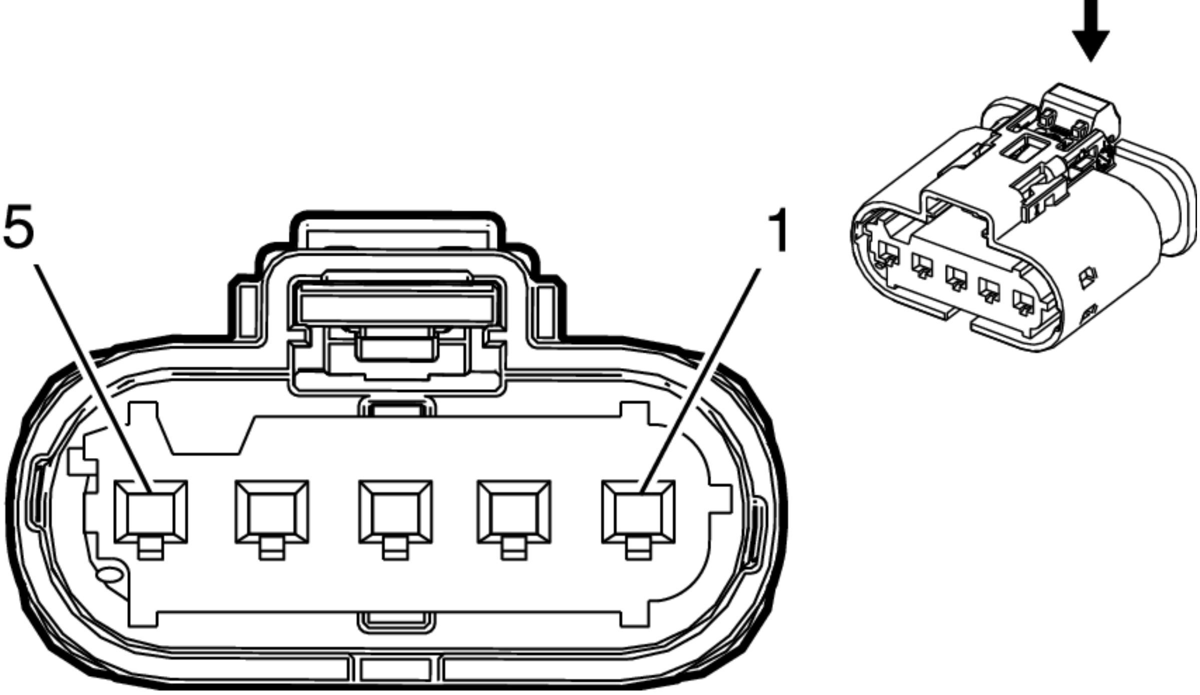
- Harness Type: Engine
- OEM Connector: 4-2272004-1
- Service Connector: 19352065
- Description: 3-Way F 1.2 MCP Series, Sealed (BN)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BK	350	Ground	I	-
2	0.5	RD/WH	3440	Battery Positive Voltage	I	-
3	-	-	-	Not Occupied	-	-

G37 HYBRID/EV BATTERY PACK COOLANT PUMP



Connector Part Information

- Harness Type: Engine
- OEM Connector: 9408621
- Service Connector: 19300589
- Description: 5-Way F 1.2 Multilock Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	WH/GN	3794	Rechargeable Energy Storage System 1 Coolant Motor Control	I	-
2	0.5	YE/GY	3796	Rechargeable Energy Storage System 1 Coolant Motor Feedback Signal	I	-
3	0.5	BU/VT	3795	Rechargeable Energy Storage System 1 Coolant Motor Control	I	-
4	0.5	BK	350	Ground	I	-
5	0.5	RD/GY	3540	Battery Positive Voltage	I	-

K1 14V POWER MODULE X1

-

Connector Part Information

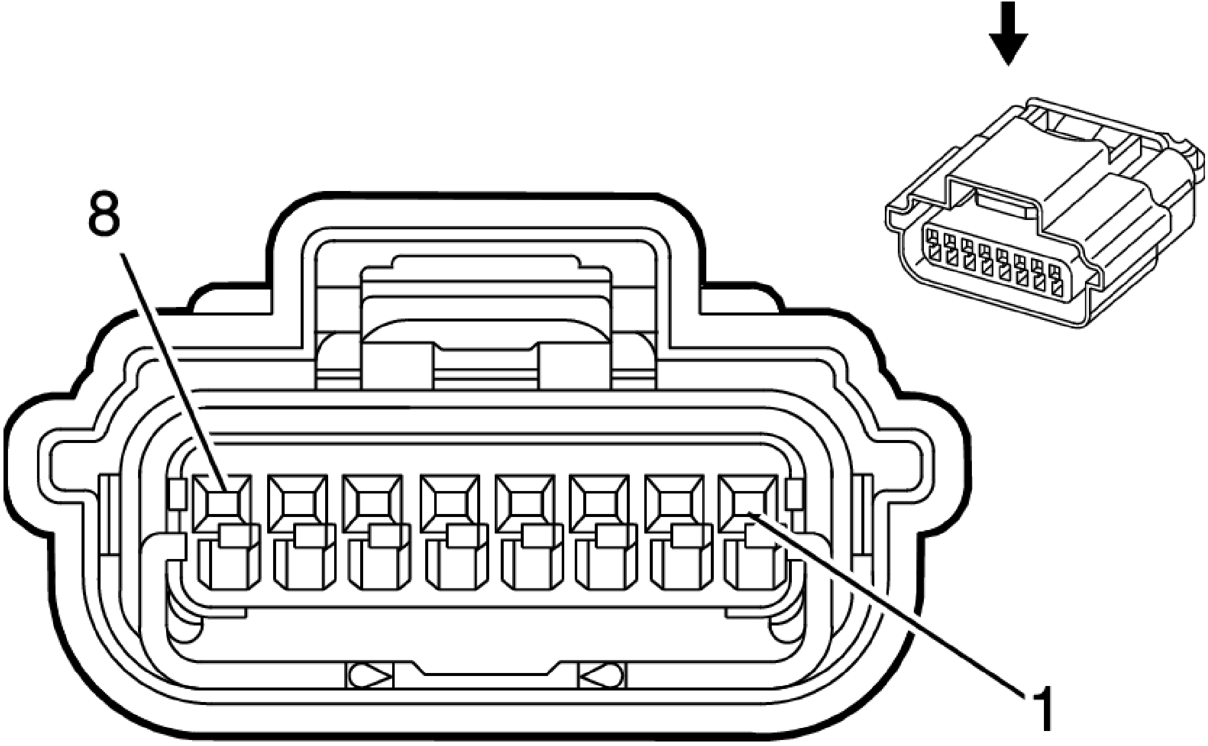
- Harness Type: Engine
- OEM Connector: 13511583
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
A	-	OG/BK	3833	High Voltage Battery 2 (-)	I	-
B	-	OG	3834	High Voltage Battery 2 (+)	I	-

K1 14V POWER MODULE X2



Connector Part Information

- Harness Type: Engine
- OEM Connector: ATSSPB-C0802Y-1AK
- Service Connector: 19352910
- Description: 8-Way F 0.64 Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

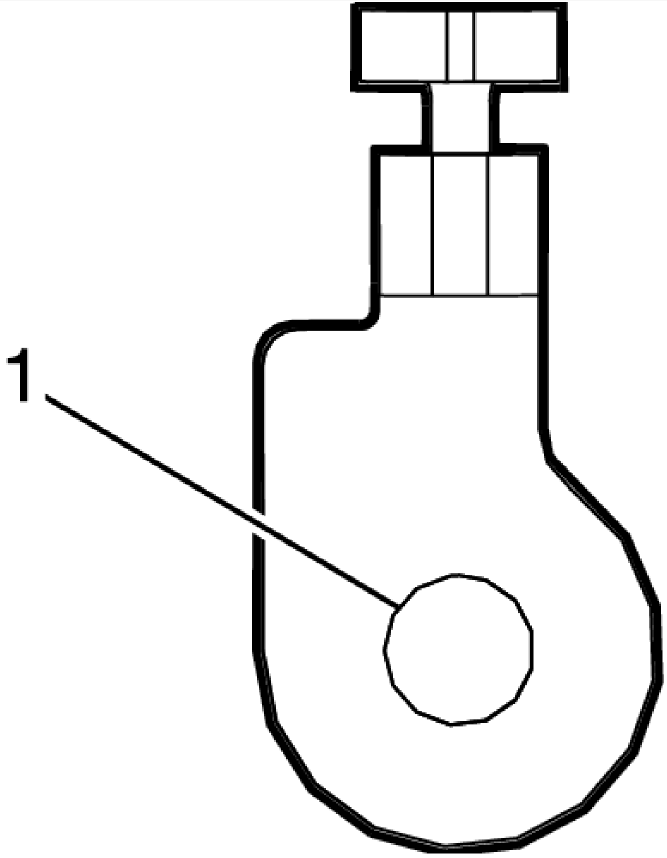
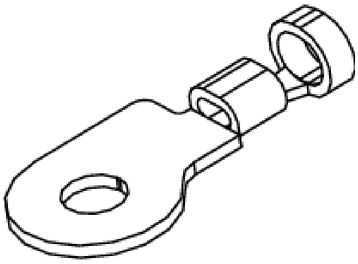
2	-	-	-	Not Occupied	-	-
3	0.5	GY	23	Generator Field Duty Cycle Signal	I	-
4 - 8	-	-	-	Not Occupied	-	-

K1 14V POWER MODULE X3





Connector Part Information

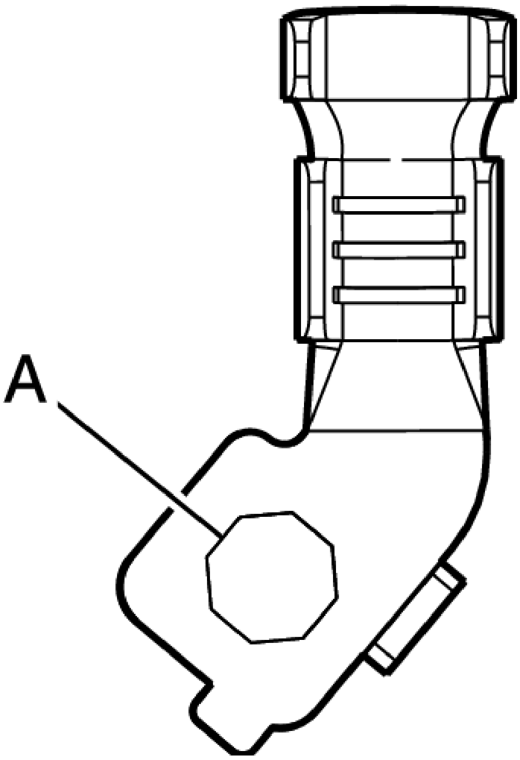
- Harness Type: Battery Cable
- OEM Connector: 33194395
- Service Connector: Service by Cable Assembly - See Part Catalog
- Description: 1-Way Ring Terminal

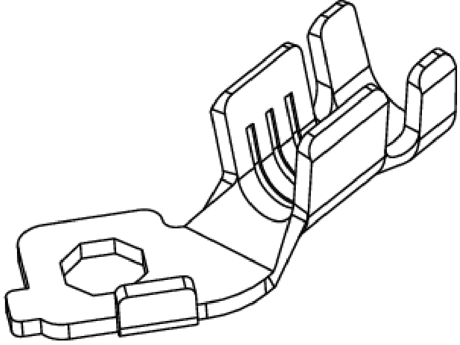
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	No Tool Required	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	25	RD/YE	2	Battery Positive Voltage	I	-

K1 14V POWER MODULE X4





Connector Part Information

- Harness Type: Battery Cable
- OEM Connector: CBR669-012
- Service Connector: Service by Cable Assembly - See Part Catalog
- Description: 1-Way Ring Terminal

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	No Tool Required	No Tool Required	Not Required	Not Required	Not Required	Not Required

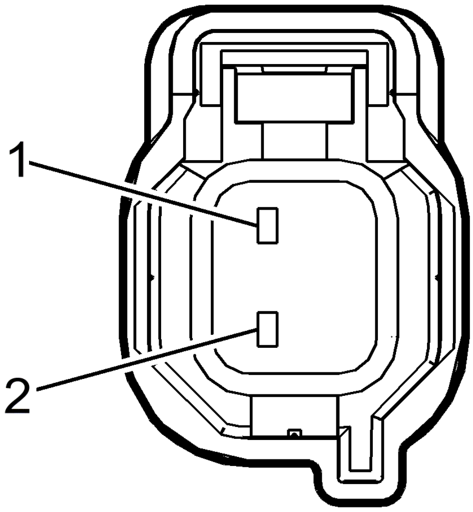
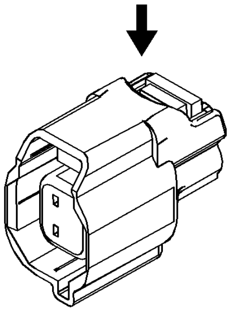
1	0.75	BN/BU	118	Left Front Speaker Signal (-) 1	I	UQ3
2	0.75	BU	201	Left Front Speaker Control (+) 1	I	UQ3

P19AG SPEAKER - LEFT FRONT DOOR (UQA)





Connector Part Information

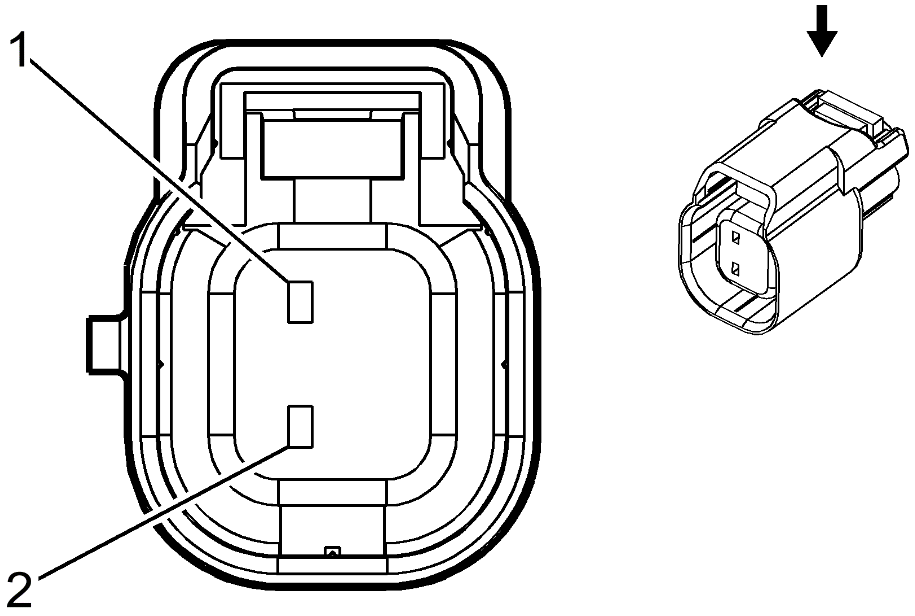
- Harness Type: Driver Door
- OEM Connector: 34062-0022
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.5 Series, Sealed (L-GY)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.75	BN/BU	118	Left Front Speaker Signal (-) 1	I	UQA
2	0.75	BU	201	Left Front Speaker Control (+) 1	I	UQA

P19AH SPEAKER - RIGHT FRONT DOOR (UQ3)



Connector Part Information

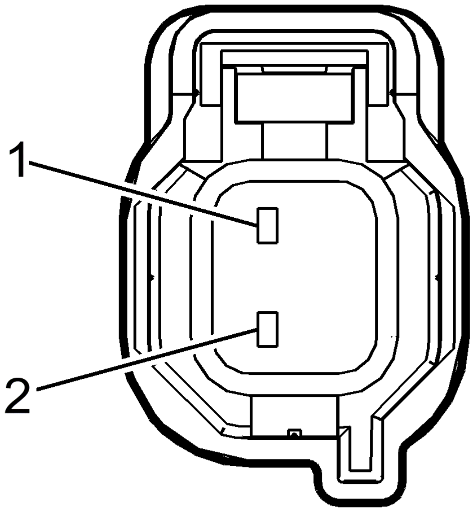
- Harness Type: Passenger Door
- OEM Connector: 34062-0046
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.5 Series, Sealed (BK)

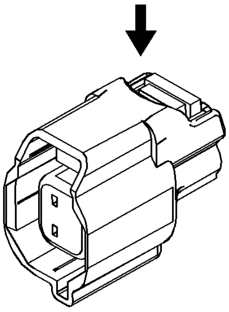
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.75	YE/BK	117	Right Front Speaker Signal (-) 1	I	UQ3
2	0.75	YE	200	Right Front Speaker Control (+) 1	I	UQ3

P19AH SPEAKER - RIGHT FRONT DOOR (UQA)





Connector Part Information

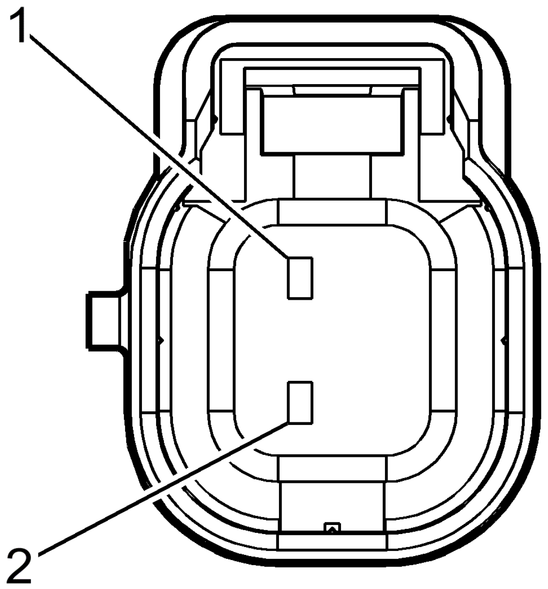
- Harness Type: Passenger Door
- OEM Connector: 34062-0022
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.5 Series, Sealed (L-GY)

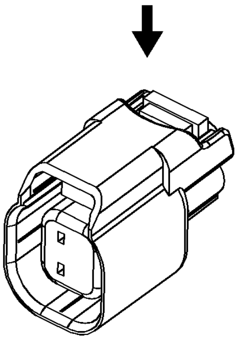
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.75	YE/BK	117	Right Front Speaker Signal (-) 1	I	UQA
2	0.75	YE	200	Right Front Speaker Control (+) 1	I	UQA

P19AL SPEAKER - LEFT REAR DOOR (UQ3)





Connector Part Information

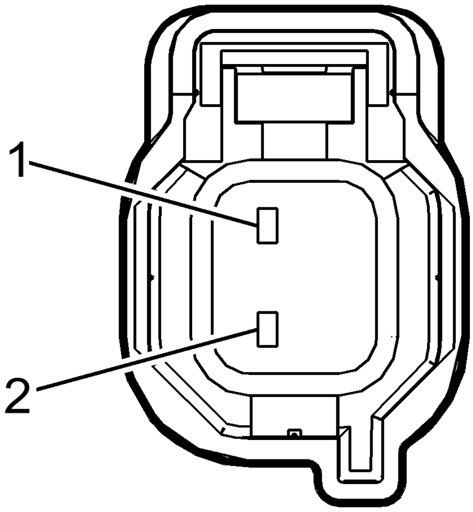
- Harness Type: Left Rear Door
- OEM Connector: 34062-0046
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.5 Series, Sealed (BK)

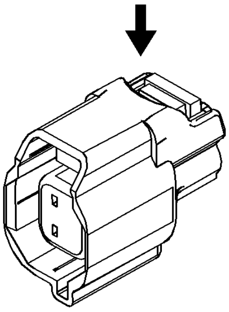
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.75	GN/BK	116	Left Rear Speaker Signal (-)	I	UQ3
2	0.75	GN	199	Left Rear Speaker Control (+)	I	UQ3

P19AL SPEAKER - LEFT REAR DOOR (UQA)





Connector Part Information

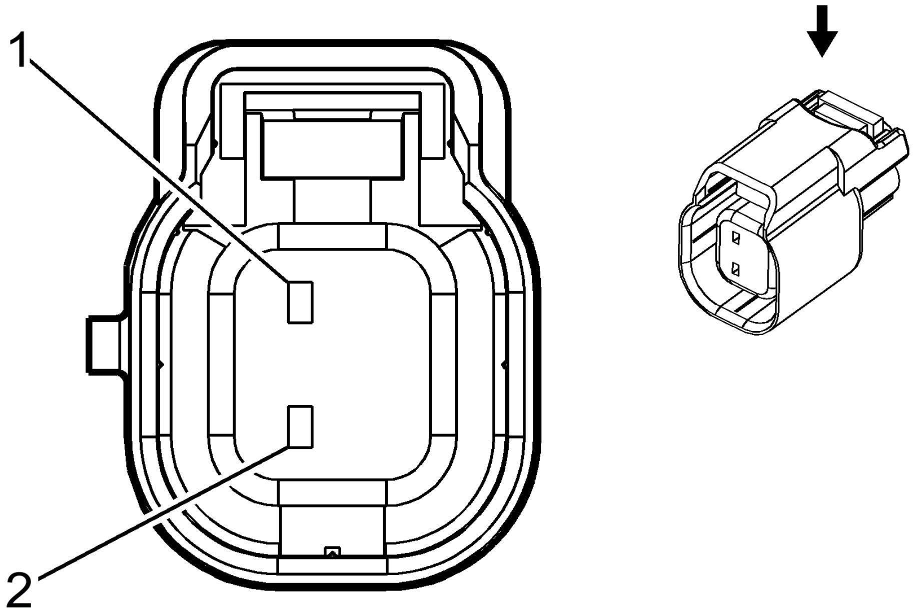
- Harness Type: Left Rear Door
- OEM Connector: 34062-0022
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.5 Series, Sealed (L-GY)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.75	GN/BK	116	Left Rear Speaker Signal (-)	I	UQA
2	0.75	GN	199	Left Rear Speaker Control (+)	I	UQA

P19AM SPEAKER - RIGHT REAR DOOR (UQ3)



Connector Part Information

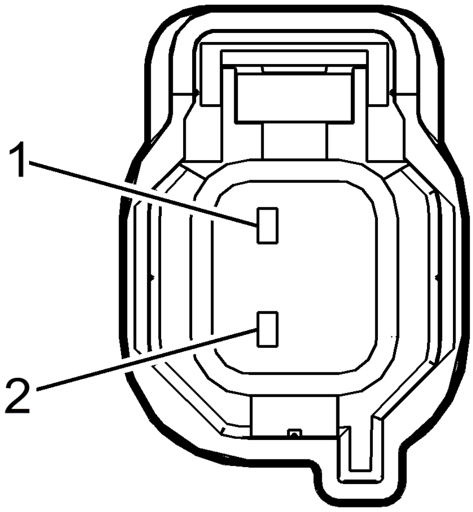
- Harness Type: Right Rear Door
- OEM Connector: 34062-0046
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.5 Series, Sealed (BK)

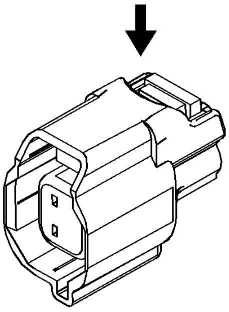
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.75	BU/BK	115	Right Rear Speaker Signal (-)	I	UQ3
2	0.75	WH	46	Right Rear Speaker Control (+)	I	UQ3

P19AM SPEAKER - RIGHT REAR DOOR (UQA)





Connector Part Information

- Harness Type: Right Rear Door
- OEM Connector: 34062-0022
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.5 Series, Sealed (L-GY)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	No Tool Required	Not Required	Not Required	Not Required	Not Required

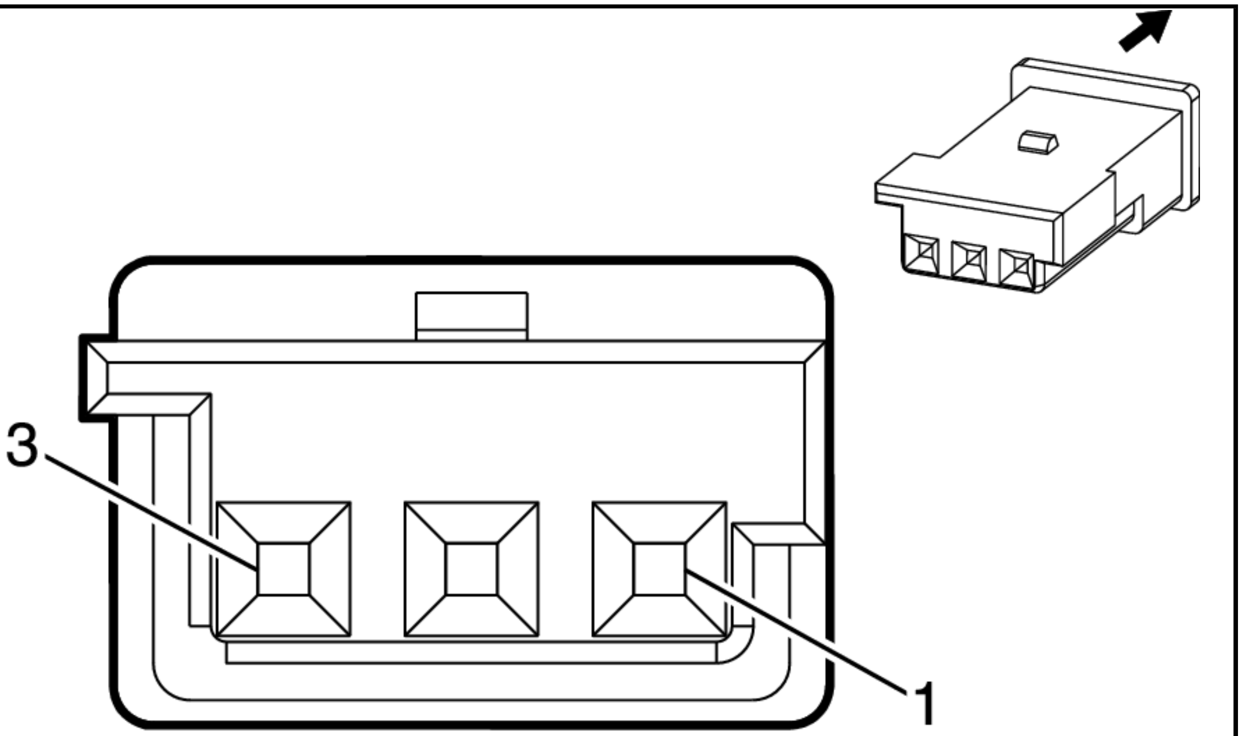
1	- -	BK GN/OG	1650 4313	Ground Radio Favorite Forward Signal	I I	- -
2	-	GY/OG	4312	Radio Favorite Back Signal	I	-
3	-	BK	1650	Ground	I	-
4	-	YE	6817	LED Backlight Dimming Control	I	-

S70F STEERING WHEEL CONTROLS SWITCH - RADIO VOLUME



Connector Part Information

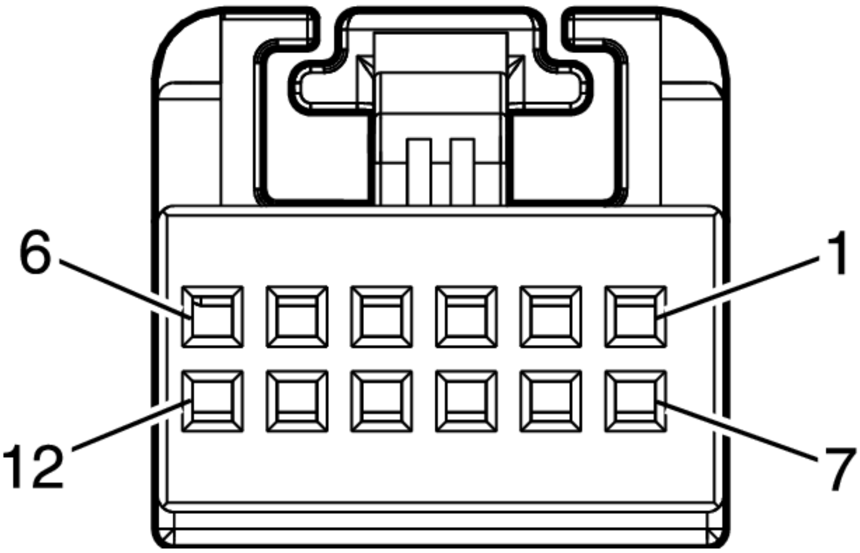
- Harness Type: Steering Wheel Harness
- OEM Connector: 19153569
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F Micro-Quadlock Series (PU)

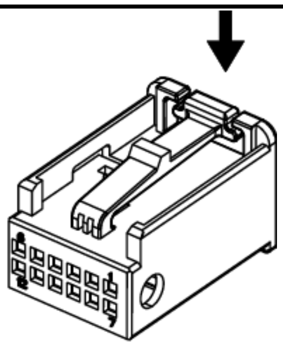
Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	-	BK/BU	4315	Radio Volume Up Signal	I	-
2	-	BU/RD	4314	Radio Volume Down Signal	I	-
3	-	BK	1650	Ground	I	-

S70L STEERING WHEEL CONTROLS SWITCH - LEFT





Connector Part Information

- Harness Type: Steering Wheel Harness
- OEM Connector: 13578796
- Service Connector: Service by Harness - See Part Catalog
- Description: 12-Way F 0.64 GET Series (BK with BK Case)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required
